## UNIVARIATE ORE POLYNOMIALS

### 1.1 Univariate Ore polynomial rings

This module provides the `OrePolynomialRing`, which constructs a general dense univariate Ore polynomial ring over a commutative base with equipped with an endomorphism and/or a derivation.

AUTHOR:

- Xavier Caruso (2020-04)

```
class sage.rings.polynomial.ore_polynomial_ring.OrePolynomialRing(base_ring, morphism,
                                                               derivation, name, sparse,
                                                               category=None)
```

Bases: `UniqueRepresentation, Parent`

Construct and return the globally unique Ore polynomial ring with the given properties and variable names.

Given a ring  $R$  and a ring automorphism  $\sigma$  of  $R$  and a  $\sigma$ -derivation  $\partial$ , the ring of Ore polynomials  $R[X; \sigma, \partial]$  is the usual abelian group polynomial  $R[X]$  equipped with the modification multiplication deduced from the rule  $Xa = \sigma(a)X + \partial(a)$ . We refer to [Ore1933] for more material on Ore polynomials.

INPUT:

- `base_ring` – a commutative ring
- `twisting_map` – either an endomorphism of the base ring, or a (twisted) derivation of it
- `names` – string or list of strings
- `sparse` – boolean (default: `False`); currently not supported

EXAMPLES:

#### The case of a twisting endomorphism

We create the Ore ring  $\mathbf{F}_{5^3}[x, \text{Frob}]$  where Frob is the Frobenius endomorphism:

```
sage: # needs sage.rings.finite_rings
sage: k.<a> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S = OrePolynomialRing(k, Frob, 'x'); S
Ore Polynomial Ring in x over Finite Field in a of size 5^3 twisted by a |--> a^5
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=('a',)); (a,) = k._first_ngens(1)
```

(continues on next page)

(continued from previous page)

```
>>> Frob = k.frobenius_endomorphism()
>>> S = OrePolynomialRing(k, Frob, 'x'); S
Ore Polynomial Ring in x over Finite Field in a of size 5^3 twisted by a |--> a^5
```

In particular, observe that it is not needed to create and pass in the twisting derivation (which is 0 in our example).

As a shortcut, we can use the square brackets notation as follow:

```
sage: # needs sage.rings.finite_rings
sage: T.<x> = k['x', Frob]; T
Ore Polynomial Ring in x over Finite Field in a of size 5^3 twisted by a |--> a^5
sage: T is S
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> T = k['x', Frob]; (x,) = T._first_ngens(1); T
Ore Polynomial Ring in x over Finite Field in a of size 5^3 twisted by a |--> a^5
>>> T is S
True
```

We emphasize that it is necessary to repeat the name of the variable in the right hand side. Indeed, the following fails (it is interpreted by Sage as a classical polynomial ring with variable name `Frob`):

```
sage: T.<x> = k[Frob]
needs sage.rings.finite_rings
Traceback (most recent call last):
...
ValueError: variable name 'Frobenius endomorphism a |--> a^5 on
Finite Field in a of size 5^3' is not alphanumeric
```

```
>>> from sage.all import *
>>> T = k[Frob]; (x,) = T._first_ngens(1) # needs sage.rings.finite_rings
Traceback (most recent call last):
...
ValueError: variable name 'Frobenius endomorphism a |--> a^5 on
Finite Field in a of size 5^3' is not alphanumeric
```

Note moreover that, similarly to the classical case, using the brackets notation also sets the variable:

```
sage: x.parent() is S
needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> x.parent() is S
needs sage.rings.finite_rings
True
```

We are now ready to carry on computations in the Ore ring:

```
sage: x*a
needs sage.rings.finite_rings
```

(continues on next page)

(continued from previous page)

```
(2*a^2 + 4*a + 4)*x
sage: Frob(a)*x
˓needs sage.rings.finite_rings
(2*a^2 + 4*a + 4)*x
```

```
>>> from sage.all import *
>>> x*a
˓needs sage.rings.finite_rings
(2*a^2 + 4*a + 4)*x
>>> Frob(a)*x
˓needs sage.rings.finite_rings
(2*a^2 + 4*a + 4)*x
```

### The case of a twisting derivation

We can similarly create the Ore ring of differential operators over  $\mathbf{Q}[t]$ , namely  $\mathbf{Q}[t][d, \frac{d}{dt}]$ :

```
sage: # needs sage.rings.finite_rings
sage: R.<t> = QQ[]
sage: der = R.derivation(); der
d/dt
sage: A = OrePolynomialRing(R, der, 'd'); A
Ore Polynomial Ring in d over Univariate Polynomial Ring in t
over Rational Field twisted by d/dt
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> der = R.derivation(); der
d/dt
>>> A = OrePolynomialRing(R, der, 'd'); A
Ore Polynomial Ring in d over Univariate Polynomial Ring in t
over Rational Field twisted by d/dt
```

Again, the brackets notation is available:

```
sage: B.<d> = R['d', der]
˓needs sage.rings.finite_rings
sage: A is B
˓needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> B = R['d', der]; (d,) = B._first_ngens(1) # needs sage.rings.finite_rings
>>> A is B
˓needs sage.rings.finite_rings
True
```

and computations can be carried out:

```
sage: d*t
˓needs sage.rings.finite_rings
t*d + 1
```

```
>>> from sage.all import *
>>> d*t
˓needs sage.rings.finite_rings
t*d + 1
```

### The combined case

Ore polynomial rings involving at the same time a twisting morphism  $\sigma$  and a twisting  $\sigma$ -derivation can be created as well as follows:

```
sage: # needs sage.rings.padics
sage: F.<u> = Qq(3^2)
sage: sigma = F.frobenius_endomorphism(); sigma
Frobenius endomorphism on 3-adic Unramified Extension Field in u
defined by  $x^2 + 2x + 2$  lifting  $u \mapsto u^3$  on the residue field
sage: der = F.derivation(3, twist=sigma); der
(3 + O(3^21))*([Frob] - id)
sage: M.<X> = F['X', der]; M
Ore Polynomial Ring in X over 3-adic Unramified Extension Field in u
defined by  $x^2 + 2x + 2$  twisted by Frob and (3 + O(3^21))*([Frob] - id)
```

```
>>> from sage.all import *
>>> # needs sage.rings.padics
>>> F = Qq(Integer(3)**Integer(2), names=('u',)); (u,) = F._first_ngens(1)
>>> sigma = F.frobenius_endomorphism(); sigma
Frobenius endomorphism on 3-adic Unramified Extension Field in u
defined by  $x^2 + 2x + 2$  lifting  $u \mapsto u^3$  on the residue field
>>> der = F.derivation(Integer(3), twist=sigma); der
(3 + O(3^21))*([Frob] - id)
>>> M = F['X', der]; (X,) = M._first_ngens(1); M
Ore Polynomial Ring in X over 3-adic Unramified Extension Field in u
defined by  $x^2 + 2x + 2$  twisted by Frob and (3 + O(3^21))*([Frob] - id)
```

We emphasize that we only need to pass in the twisted derivation as it already contains in it the datum of the twisting endomorphism. Actually, passing in both twisting maps results in an error:

```
sage: F['X', sigma, der]
˓needs sage.rings.padics
Traceback (most recent call last):
...
ValueError: variable name 'Frobenius endomorphism ...' is not alphanumeric
```

```
>>> from sage.all import *
>>> F['X', sigma, der]
˓needs sage.rings.padics
Traceback (most recent call last):
...
ValueError: variable name 'Frobenius endomorphism ...' is not alphanumeric
```

## Examples of variable name context

Consider the following:

```
sage: R.<t> = ZZ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = SkewPolynomialRing(R, sigma); S
Ore Polynomial Ring in x over Univariate Polynomial Ring in t over Integer Ring
twisted by t |--> t + 1
```

```
>>> from sage.all import *
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = SkewPolynomialRing(R, sigma, names=('x',)); (x,) = S._first_ngens(1); S
Ore Polynomial Ring in x over Univariate Polynomial Ring in t over Integer Ring
twisted by t |--> t + 1
```

The names of the variables defined above cannot be arbitrarily modified because each Ore polynomial ring is unique in Sage and other objects in Sage could have pointers to that Ore polynomial ring.

However, the variable can be changed within the scope of a `with` block using the `localvars` context:

```
sage: R.<t> = ZZ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = SkewPolynomialRing(R, sigma); S
Ore Polynomial Ring in x over Univariate Polynomial Ring in t over Integer Ring
twisted by t |--> t + 1

sage: with localvars(S, ['y']):
....:     print(S)
Ore Polynomial Ring in y over Univariate Polynomial Ring in t over Integer Ring
twisted by t |--> t + 1
```

```
>>> from sage.all import *
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = SkewPolynomialRing(R, sigma, names=('x',)); (x,) = S._first_ngens(1); S
Ore Polynomial Ring in x over Univariate Polynomial Ring in t over Integer Ring
twisted by t |--> t + 1

>>> with localvars(S, ['y']):
...     print(S)
Ore Polynomial Ring in y over Univariate Polynomial Ring in t over Integer Ring
twisted by t |--> t + 1
```

## Uniqueness and immutability

In Sage, there is exactly one Ore polynomial ring for each quadruple (base ring, twisting morphism, twisting derivation, name of the variable):

```
sage: # needs sage.rings.finite_rings
sage: k.<a> = GF(7^3)
sage: Frob = k.frobenius_endomorphism()
sage: S = k['x', Frob]
```

(continues on next page)

(continued from previous page)

```
sage: T = k['x', Frob]
sage: S is T
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(7)**Integer(3), names=('a',)); (a,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]
>>> T = k['x', Frob]
>>> S is T
True
```

Rings with different variables names are different:

```
sage: S is k['y', Frob]
# needs sage.rings.finite_rings
False
```

```
>>> from sage.all import *
>>> S is k['y', Frob]
# needs sage.rings.finite_rings
False
```

Similarly, varying the twisting morphisms yields to different Ore rings (expect when the morphism coincide):

```
sage: S is k['x', Frob^2]
# needs sage.rings.finite_rings
False
sage: S is k['x', Frob^3]
# needs sage.rings.finite_rings
False
sage: S is k['x', Frob^4]
# needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> S is k['x', Frob**Integer(2)]
# needs sage.rings.finite_rings
False
>>> S is k['x', Frob**Integer(3)]
# needs sage.rings.finite_rings
False
>>> S is k['x', Frob**Integer(4)]
# needs sage.rings.finite_rings
True
```

## Todo

- Sparse Ore Polynomial Ring

- Multivariate Ore Polynomial Ring

**Element = None**

**change\_var(var)**

Return the Ore polynomial ring in variable `var` with the same base ring, twisting morphism and twisting derivation as `self`.

**INPUT:**

- `var` – string representing the name of the new variable

**EXAMPLES:**

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: R.<x> = OrePolynomialRing(k,Frob); R
Ore Polynomial Ring in x over Finite Field in t of size 5^3 twisted by t |-->_
˓→t^5
sage: Ry = R.change_var('y'); Ry
Ore Polynomial Ring in y over Finite Field in t of size 5^3 twisted by t |-->_
˓→t^5
sage: Ry is R.change_var('y')
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> R = OrePolynomialRing(k,Frob, names=('x',)); (x,) = R._first_ngens(1); R
Ore Polynomial Ring in x over Finite Field in t of size 5^3 twisted by t |-->_
˓→t^5
>>> Ry = R.change_var('y'); Ry
Ore Polynomial Ring in y over Finite Field in t of size 5^3 twisted by t |-->_
˓→t^5
>>> Ry is R.change_var('y')
True
```

**characteristic()**

Return the characteristic of the base ring of `self`.

**EXAMPLES:**

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: R['x',sigma].characteristic()
0

sage: # needs sage.rings.finite_rings
sage: k.<u> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: k['y',Frob].characteristic()
5
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> R['x',sigma].characteristic()
0

>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='u'); (u,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> k['y',Frob].characteristic()
5
```

**`fraction_field()`**

Return the fraction field of this skew ring.

**EXAMPLES:**

```
sage: # needs sage.rings.finite_rings
sage: k.<a> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: K = S.fraction_field(); K
Ore Function Field in x over Finite Field in a of size 5^3 twisted by a |-->_a^5
sage: f = 1/(x + a); f
(x + a)^(-1)
sage: f.parent() is K
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='a'); (a,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> K = S.fraction_field(); K
Ore Function Field in x over Finite Field in a of size 5^3 twisted by a |-->_a^5
sage: f = Integer(1)/(x + a); f
(x + a)^(-1)
sage: f.parent() is K
True
```

Below is another example with differentiel operators:

```
sage: R.<t> = QQ[]
sage: der = R.derivation()
sage: A.<d> = R['d', der]
sage: A.fraction_field()
Ore Function Field in d over Fraction Field of Univariate Polynomial Ring in t
over Rational Field twisted by d/dt
sage: f = t/d; f
(d - 1/t)^(-1) * t
sage: f*d
```

(continues on next page)

(continued from previous page)

t

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> der = R.derivation()
>>> A = R['d', der]; (d,) = A._first_ngens(1)
>>> A.fraction_field()
Ore Function Field in d over Fraction Field of Univariate Polynomial Ring in t
over Rational Field twisted by d/dt
>>> f = t/d; f
(d - 1/t)^(-1) * t
>>> f*d
t
```

 See also

[sage.rings.polynomial.ore\\_function\\_field](#)

### gen (n=0)

Return the indeterminate generator of this Ore polynomial ring.

INPUT:

- n – index of generator to return (default: 0); exists for compatibility with other polynomial rings

EXAMPLES:

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]; S
Ore Polynomial Ring in x over Univariate Polynomial Ring in t
over Rational Field twisted by t |--> t + 1
sage: y = S.gen(); y
x
sage: y == x
True
sage: S.gen(0)
x
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1); S
Ore Polynomial Ring in x over Univariate Polynomial Ring in t
over Rational Field twisted by t |--> t + 1
>>> y = S.gen(); y
x
>>> y == x
True
>>> S.gen(Integer(0))
x
```

This is also known as the parameter:

```
sage: S.parameter() is S.gen()
True
```

```
>>> from sage.all import *
>>> S.parameter() is S.gen()
True
```

### **gens()**

Return the tuple of generators of `self`.

EXAMPLES:

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]; S
Ore Polynomial Ring in x over Univariate Polynomial Ring in t
over Rational Field twisted by t |--> t + 1
sage: S.gens()
(x,
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1); S
Ore Polynomial Ring in x over Univariate Polynomial Ring in t
over Rational Field twisted by t |--> t + 1
>>> S.gens()
(x,
```

### **gens\_dict()**

Return a {name: variable} dictionary of the generators of this Ore polynomial ring.

EXAMPLES:

```
sage: R.<t> = ZZ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = SkewPolynomialRing(R,sigma)
sage: S.gens_dict()
{'x': x}
```

```
>>> from sage.all import *
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = SkewPolynomialRing(R,sigma, names=(t,x,)); (x,) = S._first_ngens(1)
>>> S.gens_dict()
{'x': x}
```

### **is\_exact()**

Return `True` if elements of this Ore polynomial ring are exact.

This happens if and only if elements of the base ring are exact.

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: S.is_exact()
True
sage: S.base_ring().is_exact()
True
sage: R.<u> = k[[]]
sage: sigma = R.hom([u + u^2])
sage: T.<y> = R['y', sigma]
sage: T.is_exact()
False
sage: T.base_ring().is_exact()
False
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> S.is_exact()
True
>>> S.base_ring().is_exact()
True
>>> R = k[['u']]; (u,) = R._first_ngens(1)
>>> sigma = R.hom([u + u**Integer(2)])
>>> T = R['y', sigma]; (y,) = T._first_ngens(1)
>>> T.is_exact()
False
>>> T.base_ring().is_exact()
False
```

**is\_field(*proof=False*)**

Return always False since Ore polynomial rings are never fields.

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<a> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: S.is_field()
False
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=('a',)); (a,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> S.is_field()
False
```

**is\_finite()**

Return `False` since Ore polynomial rings are not finite (unless the base ring is 0).

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: k.is_finite()
True
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: S.is_finite()
False
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='t,); (t,) = k._first_ngens(1)
>>> k.is_finite()
True
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> S.is_finite()
False
```

**is\_sparse()**

Return `True` if the elements of this Ore polynomial ring are sparsely represented.

**Warning**

Since sparse Ore polynomials are not yet implemented, this function always returns `False`.

EXAMPLES:

```
sage: R.<t> = RR[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: S.is_sparse()
False
```

```
>>> from sage.all import *
>>> R = RR['t,]; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> S.is_sparse()
False
```

**ngens()**

Return the number of generators of this Ore polynomial ring.

This is 1.

EXAMPLES:

```
sage: R.<t> = RR[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: S.ngens()
1
```

```
>>> from sage.all import *
>>> R = RR['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> S.ngens()
1
```

**parameter (n=0)**

Return the indeterminate generator of this Ore polynomial ring.

**INPUT:**

- n – index of generator to return (default: 0); exists for compatibility with other polynomial rings

**EXAMPLES:**

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]; S
Ore Polynomial Ring in x over Univariate Polynomial Ring in t
over Rational Field twisted by t |--> t + 1
sage: y = S.gen(); y
x
sage: y == x
True
sage: S.gen(0)
x
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1); S
Ore Polynomial Ring in x over Univariate Polynomial Ring in t
over Rational Field twisted by t |--> t + 1
>>> y = S.gen(); y
x
>>> y == x
True
>>> S.gen(Integer(0))
x
```

This is also known as the parameter:

```
sage: S.parameter() is S.gen()
True
```

```
>>> from sage.all import *
>>> S.parameter() is S.gen()
True
```

### `quotient_module(P, names=None)`

Return the quotient ring  $A/AP$  as a module over  $A$  where  $A$  is this Ore polynomial ring.

INPUT:

- `names` (default: `None`) – a string or a list of strings, the names of the vectors of the canonical basis

EXAMPLES:

```
sage: k.<a> = GF(5^3)
sage: S.<x> = k['a', k.frobenius_endomorphism()]
sage: P = x^3 + a*x^2 + a^2 + 1
sage: M = S.quotient_module(P)
sage: M
Ore module of rank 3 over Finite Field in a of size 5^3 twisted by a |--> a^5
```

```
>>> from sage.all import *
>>> k = GF(Integer(5)**Integer(3), names=('a',)); (a,) = k._first_ngens(1)
>>> S = k['a', k.frobenius_endomorphism()]; (x,) = S._first_ngens(1)
>>> P = x**Integer(3) + a*x**Integer(2) + a**Integer(2) + Integer(1)
>>> M = S.quotient_module(P)
>>> M
Ore module of rank 3 over Finite Field in a of size 5^3 twisted by a |--> a^5
```

The argument `names` can be used to give chosen names to the vectors in the canonical basis:

```
sage: M = S.quotient_module(P, names=('u', 'v', 'w'))
sage: M.basis()
[u, v, w]
```

```
>>> from sage.all import *
>>> M = S.quotient_module(P, names=('u', 'v', 'w'))
>>> M.basis()
[u, v, w]
```

or even:

```
sage: M = S.quotient_module(P, names='e')
sage: M.basis()
[e0, e1, e2]
```

```
>>> from sage.all import *
>>> M = S.quotient_module(P, names='e')
>>> M.basis()
[e0, e1, e2]
```

Note that the bracket construction also works:

```
sage: M.<u,v,w> = S.quotient_module(P)
sage: M.basis()
[u, v, w]
```

```
>>> from sage.all import *
>>> M = S.quotient_module(P, names=('u', 'v', 'w',)); (u, v, w,) = M._first_
    .ngens(3)
>>> M.basis()
[u, v, w]
```

With this construction, the vectors  $u$ ,  $v$  and  $w$  are directly available in the namespace:

```
sage: x*u + v
2*v
```

```
>>> from sage.all import *
>>> x*u + v
2*v
```

We refer to `sage.modules.ore_module` for a tutorial on Ore modules in SageMath.

### See also

`sage.modules.ore_module`

**random\_element** (*degree=(-1, 2), monic=False, \*args, \*\*kwds*)

Return a random Ore polynomial in this ring.

INPUT:

- *degree* – (default: `(-1, 2)`) integer with degree or a tuple of integers with minimum and maximum degrees
- *monic* – boolean (default: `False`); if `True`, return a monic Ore polynomial
- *\*args, \*\*kwds* – passed on to the `random_element` method for the base ring

OUTPUT:

Ore polynomial such that the coefficients of  $x^i$ , for  $i$  up to `degree`, are random elements from the base ring, randomized subject to the arguments `*args` and `**kwds`.

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: S.random_element()  # random
(2*t^2 + 3)*x^2 + (4*t^2 + t + 4)*x + 2*t^2 + 2
sage: S.random_element(monic=True)  # random
x^2 + (2*t^2 + t + 1)*x + 3*t^2 + 3*t + 2
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='t',); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> S.random_element() # random
(2*t^2 + 3)*x^2 + (4*t^2 + t + 4)*x + 2*t^2 + 2
>>> S.random_element(monic=True) # random
x^2 + (2*t^2 + t + 1)*x + 3*t^2 + 3*t + 2
```

Use degree to obtain polynomials of higher degree:

```
sage: # needs sage.rings.finite_rings
sage: p = S.random_element(degree=5) # random
(t^2 + 3*t)*x^5 + (4*t + 4)*x^3 + (4*t^2 + 4*t)*x^2 + (2*t^2 + 1)*x + 3
sage: p.degree() == 5
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> p = S.random_element(degree=Integer(5)) # random
(t^2 + 3*t)*x^5 + (4*t + 4)*x^3 + (4*t^2 + 4*t)*x^2 + (2*t^2 + 1)*x + 3
>>> p.degree() == Integer(5)
True
```

If a tuple of two integers is given for the degree argument, a random integer will be chosen between the first and second element of the tuple as the degree, both inclusive:

```
sage: S.random_element(degree=(2,7)) # random
needs sage.rings.finite_rings
(3*t^2 + 1)*x^4 + (4*t + 2)*x^3 + (4*t + 1)*x^2
+ (t^2 + 3*t + 3)*x + 3*t^2 + 2*t + 2
```

```
>>> from sage.all import *
>>> S.random_element(degree=(Integer(2),Integer(7))) # random
# needs sage.rings.finite_rings
(3*t^2 + 1)*x^4 + (4*t + 2)*x^3 + (4*t + 1)*x^2
+ (t^2 + 3*t + 3)*x + 3*t^2 + 2*t + 2
```

**random\_irreducible**(*degree*=2, *monic*=True, \**args*, \*\**kwds*)

Return a random irreducible Ore polynomial.

### ⚠ Warning

Elements of this Ore polynomial ring need to have a method `is_irreducible()`. Currently, this method is implemented only when the base ring is a finite field.

INPUT:

- *degree* – integer with degree (default: 2) or a tuple of integers with minimum and maximum degrees
- *monic* – if True, returns a monic Ore polynomial (default: True)

- `*args, **kwds` – passed in to the `random_element` method for the base ring

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: A = S.random_irreducible()
sage: A.is_irreducible()
True
sage: B = S.random_irreducible(degree=3, monic=False)
sage: B.is_irreducible()
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='t',); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> A = S.random_irreducible()
>>> A.is_irreducible()
True
>>> B = S.random_irreducible(degree=Integer(3), monic=False)
>>> B.is_irreducible()
True
```

### `twisting_derivation()`

Return the twisting derivation defining this Ore polynomial ring or `None` if this Ore polynomial ring is not twisted by a derivation.

EXAMPLES:

```
sage: R.<t> = QQ[]
sage: der = R.derivation(); der
d/dt
sage: A.<d> = R['d', der]
sage: A.twisting_derivation()
d/dt

sage: # needs sage.rings.finite_rings
sage: k.<a> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: S.twisting_derivation()
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> der = R.derivation(); der
d/dt
>>> A = R['d', der]; (d,) = A._first_ngens(1)
>>> A.twisting_derivation()
d/dt
```

(continues on next page)

(continued from previous page)

```
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='a'); (a,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> S.twisting_derivation()
```

 See also`twisting_morphism()``twisting_morphism(n=1)`

Return the twisting endomorphism defining this Ore polynomial ring iterated `n` times or `None` if this Ore polynomial ring is not twisted by an endomorphism.

INPUT:

- `n` – integer (default: 1)

EXAMPLES:

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x', sigma]
sage: S.twisting_morphism()
Ring endomorphism of Univariate Polynomial Ring in t over Rational Field
Defn: t |--> t + 1
sage: S.twisting_morphism() == sigma
True
sage: S.twisting_morphism(10)
Ring endomorphism of Univariate Polynomial Ring in t over Rational Field
Defn: t |--> t + 10
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x', sigma]; (x,) = S._first_ngens(1)
>>> S.twisting_morphism()
Ring endomorphism of Univariate Polynomial Ring in t over Rational Field
Defn: t |--> t + 1
>>> S.twisting_morphism() == sigma
True
>>> S.twisting_morphism(Integer(10))
Ring endomorphism of Univariate Polynomial Ring in t over Rational Field
Defn: t |--> t + 10
```

If `n` in negative, Sage tries to compute the inverse of the twisting morphism:

```
sage: # needs sage.rings.finite_rings
sage: k.<a> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: T.<y> = k['y',Frob]
```

(continues on next page)

(continued from previous page)

```
sage: T.twisting_morphism(-1)
Frobenius endomorphism a |--> a^(5^2) on Finite Field in a of size 5^3
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=('a',)); (a,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> T = k['y',Frob]; (y,) = T._first_ngens(1)
>>> T.twisting_morphism(-Integer(1))
Frobenius endomorphism a |--> a^(5^2) on Finite Field in a of size 5^3
```

Sometimes it fails, even if the twisting morphism is actually invertible:

```
sage: K = R.fraction_field()
sage: phi = K.hom([(t+1)/(t-1)])
sage: T.<y> = K['y', phi]
sage: T.twisting_morphism(-1)
Traceback (most recent call last):
...
NotImplementedError: inverse not implemented for morphisms of
Fraction Field of Univariate Polynomial Ring in t over Rational Field
```

```
>>> from sage.all import *
>>> K = R.fraction_field()
>>> phi = K.hom([(t+Integer(1))/(t-Integer(1))])
>>> T = K['y', phi]; (y,) = T._first_ngens(1)
>>> T.twisting_morphism(-Integer(1))
Traceback (most recent call last):
...
NotImplementedError: inverse not implemented for morphisms of
Fraction Field of Univariate Polynomial Ring in t over Rational Field
```

When the Ore polynomial ring is only twisted by a derivation, this method returns nothing:

```
sage: der = R.derivation()
sage: A.<d> = R['x', der]
sage: A
Ore Polynomial Ring in x over Univariate Polynomial Ring in t
over Rational Field twisted by d/dt
sage: A.twisting_morphism()
```

```
>>> from sage.all import *
>>> der = R.derivation()
>>> A = R['x', der]; (d,) = A._first_ngens(1)
>>> A
Ore Polynomial Ring in x over Univariate Polynomial Ring in t
over Rational Field twisted by d/dt
>>> A.twisting_morphism()
```

Here is an example where the twisting morphism is automatically inferred from the derivation:

```
sage: # needs sage.rings.finite_rings
sage: k.<a> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: der = k.derivation(1, twist=Frob)
sage: der
[a |--> a^5] - id
sage: S.<x> = k['x', der]
sage: S.twisting_morphism()
Frobenius endomorphism a |--> a^5 on Finite Field in a of size 5^3
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=('a',)); (a,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> der = k.derivation(Integer(1), twist=Frob)
>>> der
[a |--> a^5] - id
>>> S = k['x', der]; (x,) = S._first_ngens(1)
>>> S.twisting_morphism()
Frobenius endomorphism a |--> a^5 on Finite Field in a of size 5^3
```

## 1.2 Univariate Ore polynomials

This module provides the `OrePolynomial`, which constructs a single univariate Ore polynomial over a commutative base equipped with an endomorphism and/or a derivation. It provides generic implementation of standard arithmetical operations on Ore polynomials as addition, multiplication, gcd, lcm, etc.

The generic implementation of dense Ore polynomials is `OrePolynomial_generic_dense`. The classes `ConstantOrePolynomialSection` and `OrePolynomialBaseringInjection` handle conversion from an Ore polynomial ring to its base ring and vice versa.

#### AUTHORS:

- Xavier Caruso (2020-05)

```
class sage.rings.polynomial.ore_polynomial_element.ConstantOrePolynomialSection
Bases: Map
```

Representation of the canonical homomorphism from the constants of an Ore polynomial ring to the base ring.

This class is necessary for automatic coercion from zero-degree Ore polynomial ring into the base ring.

#### EXAMPLES:

```
sage: from sage.rings.polynomial.ore_polynomial_element import_
... ConstantOrePolynomialSection
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: m = ConstantOrePolynomialSection(S, R); m
```

(continues on next page)

(continued from previous page)

Generic map:

```
From: Ore Polynomial Ring in x over Univariate Polynomial Ring in t
      over Rational Field twisted by t |--> t + 1
To:   Univariate Polynomial Ring in t over Rational Field
```

```
>>> from sage.all import *
>>> from sage.rings.polynomial.ore_polynomial_element import_
ConstantOrePolynomialSection
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> m = ConstantOrePolynomialSection(S, R); m
Generic map:
From: Ore Polynomial Ring in x over Univariate Polynomial Ring in t
      over Rational Field twisted by t |--> t + 1
To:   Univariate Polynomial Ring in t over Rational Field
```

**class** sage.rings.polynomial.ore\_polynomial\_element.**OrePolynomial**Bases: `AlgebraElement`

Abstract base class for Ore polynomials.

This class must be inherited from and have key methods overridden.

## Definition

Let  $R$  be a commutative ring equipped with an automorphism  $\sigma$  and a  $\sigma$ -derivation  $\partial$ .

An Ore polynomial is given by the equation:

$$F(X) = a_n X^n + \cdots + a_0,$$

where the coefficients  $a_i \in R$  and  $X$  is a formal variable.Addition between two Ore polynomials is defined by the usual addition operation and the modified multiplication is defined by the rule  $Xa = \sigma(a)X + \partial(a)$  for all  $a$  in  $R$ . Ore polynomials are thus non-commutative and the degree of a product is equal to the sum of the degrees of the factors.Let  $a$  and  $b$  be two Ore polynomials in the same ring  $S$ . The *right* (*resp.* *left*) *Euclidean division* of  $a$  by  $b$  is a couple  $(q, r)$  of elements in  $S$  such that

- $a = qb + r$  (*resp.*  $a = bq + r$ )
- the degree of  $r$  is less than the degree of  $b$

 $q$  (*resp.*  $r$ ) is called the *quotient* (*resp.* the remainder) of this Euclidean division.

## Properties

Keeping the previous notation, if the leading coefficient of  $b$  is a unit (*e.g.* if  $b$  is monic) then the quotient and the remainder in the *right* Euclidean division exist and are unique.The same result holds for the *left* Euclidean division if in addition the twisting morphism defining the Ore polynomial ring is invertible.

### EXAMPLES:

We illustrate some functionalities implemented in this class.

We create the Ore polynomial ring (here the derivation is zero):

```
sage: R.<t> = ZZ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]; S
Ore Polynomial Ring in x over Univariate Polynomial Ring in t over Integer Ring
twisted by t |--> t + 1
```

```
>>> from sage.all import *
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1); S
Ore Polynomial Ring in x over Univariate Polynomial Ring in t over Integer Ring
twisted by t |--> t + 1
```

and some elements in it:

```
sage: a = t + x + 1; a
x + t + 1
sage: b = S([t^2,t+1,1]); b
x^2 + (t + 1)*x + t^2
sage: c = S.random_element(degree=3,monic=True)
sage: c.parent() is S
True
```

```
>>> from sage.all import *
>>> a = t + x + Integer(1); a
x + t + 1
>>> b = S([t**Integer(2),t+Integer(1),Integer(1)]); b
x^2 + (t + 1)*x + t^2
>>> c = S.random_element(degree=Integer(3),monic=True)
>>> c.parent() is S
True
```

Ring operations are supported:

```
sage: a + b
x^2 + (t + 2)*x + t^2 + t + 1
sage: a - b
-x^2 - t*x - t^2 + t + 1

sage: a * b
x^3 + (2*t + 3)*x^2 + (2*t^2 + 4*t + 2)*x + t^3 + t^2
sage: b * a
x^3 + (2*t + 4)*x^2 + (2*t^2 + 3*t + 2)*x + t^3 + t^2
sage: a * b == b * a
False

sage: b^2
x^4 + (2*t + 4)*x^3 + (3*t^2 + 7*t + 6)*x^2
+ (2*t^3 + 4*t^2 + 3*t + 1)*x + t^4
sage: b^2 == b*b
True
```

```
>>> from sage.all import *
>>> a + b
x^2 + (t + 2)*x + t^2 + t + 1
>>> a - b
-x^2 - t*x - t^2 + t + 1

>>> a * b
x^3 + (2*t + 3)*x^2 + (2*t^2 + 4*t + 2)*x + t^3 + t^2
>>> b * a
x^3 + (2*t + 4)*x^2 + (2*t^2 + 3*t + 2)*x + t^3 + t^2
>>> a * b == b * a
False

>>> b**Integer(2)
x^4 + (2*t + 4)*x^3 + (3*t^2 + 7*t + 6)*x^2
+ (2*t^3 + 4*t^2 + 3*t + 1)*x + t^4
>>> b**Integer(2) == b*b
True
```

Sage also implements arithmetic over Ore polynomial rings. You will find below a short panorama:

```
sage: q,r = c.right_quo_rem(b)
sage: c == q*b + r
True
```

```
>>> from sage.all import *
>>> q,r = c.right_quo_rem(b)
>>> c == q*b + r
True
```

The operators // and % give respectively the quotient and the remainder of the *right* Euclidean division:

```
sage: q == c // b
True
sage: r == c % b
True
```

```
>>> from sage.all import *
>>> q == c // b
True
>>> r == c % b
True
```

Here we can see the effect of the operator evaluation compared to the usual polynomial evaluation:

```
sage: a = x^2
sage: a(t)
doctest:....: FutureWarning: This class/method/function is marked as experimental.
It, its functionality or its interface might change without a formal deprecation.
See https://github.com/sagemath/sage/issues/13215 for details.
t + 2
```

```
>>> from sage.all import *
>>> a = x**Integer(2)
>>> a(t)
doctest:....: FutureWarning: This class/method/function is marked as experimental.
It, its functionality or its interface might change without a formal deprecation.
See https://github.com/sagemath/sage/issues/13215 for details.
t + 2
```

Here is another example over a finite field:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = x^4 + (4*t + 1)*x^3 + (t^2 + 3*t + 3)*x^2 + (3*t^2 + 2*t + 2)*x + (3*t^
+ 2 + 3*t + 1)
sage: b = (2*t^2 + 3)*x^2 + (3*t^2 + 1)*x + 4*t + 2
sage: q, r = a.left_quo_rem(b)
sage: q
(4*t^2 + t + 1)*x^2 + (2*t^2 + 2*t + 2)*x + 2*t^2 + 4*t + 3
sage: r
(t + 2)*x + 3*t^2 + 2*t + 4
sage: a == b*q + r
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='t,); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = x**Integer(4) + (Integer(4)*t + Integer(1))*x**Integer(3) +
+ (t**Integer(2) + Integer(3)*t + Integer(3))*x**Integer(2) +
+ (Integer(3)*t**Integer(2) + Integer(2)*t + Integer(2))*x +
+ (Integer(3)*t**Integer(2) + Integer(3)*t + Integer(1))
>>> b = (Integer(2)*t**Integer(2) + Integer(3))*x**Integer(2) +
+ (Integer(3)*t**Integer(2) + Integer(1))*x + Integer(4)*t + Integer(2)
>>> q, r = a.left_quo_rem(b)
>>> q
(4*t^2 + t + 1)*x^2 + (2*t^2 + 2*t + 2)*x + 2*t^2 + 4*t + 3
>>> r
(t + 2)*x + 3*t^2 + 2*t + 4
>>> a == b*q + r
True
```

Once we have Euclidean divisions, we have for free gcd and lcm (at least if the base ring is a field):

```
sage: # needs sage.rings.finite_rings
sage: a = (x + t) * (x + t^2)^2
sage: b = (x + t) * (t*x + t + 1) * (x + t^2)
sage: a.right_gcd(b)
x + t^2
sage: a.left_gcd(b)
x + t
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> a = (x + t) * (x + t**Integer(2))**Integer(2)
>>> b = (x + t) * (t*x + t + Integer(1)) * (x + t**Integer(2))
>>> a.right_gcd(b)
x + t^2
>>> a.left_gcd(b)
x + t
```

The left lcm has the following meaning: given Ore polynomials  $a$  and  $b$ , their left lcm is the least degree polynomial  $c = ua = vb$  for some Ore polynomials  $u, v$ . Such a  $c$  always exist if the base ring is a field:

```
sage: c = a.left_lcm(b); c
needs sage.rings.finite_rings
x^5 + (4*t^2 + t + 3)*x^4 + (3*t^2 + 4*t)*x^3 + 2*t^2*x^2 + (2*t^2 + t)*x + 4*t^2
+ 4
sage: c.is_right_divisible_by(a)
needs sage.rings.finite_rings
True
sage: c.is_right_divisible_by(b)
needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> c = a.left_lcm(b); c
needs sage.rings.finite_rings
x^5 + (4*t^2 + t + 3)*x^4 + (3*t^2 + 4*t)*x^3 + 2*t^2*x^2 + (2*t^2 + t)*x + 4*t^2
+ 4
>>> c.is_right_divisible_by(a)
needs sage.rings.finite_rings
True
>>> c.is_right_divisible_by(b)
needs sage.rings.finite_rings
True
```

The right lcm is defined similarly as the least degree polynomial  $c = au = bv$  for some  $u, v$ :

```
sage: d = a.right_lcm(b); d
needs sage.rings.finite_rings
x^5 + (t^2 + 1)*x^4 + (3*t^2 + 3*t + 3)*x^3 + (3*t^2 + t + 2)*x^2 + (4*t^2 +
+ 3*t)*x + 4*t + 4
sage: d.is_left_divisible_by(a)
needs sage.rings.finite_rings
True
sage: d.is_left_divisible_by(b)
needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> d = a.right_lcm(b); d
needs sage.rings.finite_rings
x^5 + (t^2 + 1)*x^4 + (3*t^2 + 3*t + 3)*x^3 + (3*t^2 + t + 2)*x^2 + (4*t^2 +
+ 3*t)*x + 4*t + 4
```

(continues on next page)

(continued from previous page)

```
>>> d.is_left_divisible_by(a)                                     #
↳ needs sage.rings.finite_rings
True
>>> d.is_left_divisible_by(b)                                     #
↳ needs sage.rings.finite_rings
True
```

 See also

- `sage.rings.polynomial.ore_polynomial_ring`

**base\_ring()**

Return the base ring of `self`.

EXAMPLES:

```
sage: R.<t> = ZZ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = S.random_element()
sage: a.base_ring()
Univariate Polynomial Ring in t over Integer Ring
sage: a.base_ring() is R
True
```

```
>>> from sage.all import *
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = S.random_element()
>>> a.base_ring()
Univariate Polynomial Ring in t over Integer Ring
>>> a.base_ring() is R
True
```

**change\_variable\_name(var)**

Change the name of the variable of `self`.

This will create the Ore polynomial ring with the new name but same base ring, twisting morphism and twisting derivation. The returned Ore polynomial will be an element of that Ore polynomial ring.

INPUT:

- `var` – the name of the new variable

EXAMPLES:

```
sage: R.<t> = ZZ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x', sigma]
sage: a = x^3 + (2*t + 1)*x + t^2 + 3*t + 5
sage: b = a.change_variable_name('y'); b
y^3 + (2*t + 1)*y + t^2 + 3*t + 5
```

```
>>> from sage.all import *
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x', sigma]; (x,) = S._first_ngens(1)
>>> a = x**Integer(3) + (Integer(2)*t + Integer(1))*x + t**Integer(2) +
... Integer(3)*t + Integer(5)
>>> b = a.change_variable_name('y'); b
y^3 + (2*t + 1)*y + t^2 + 3*t + 5
```

Note that a new parent is created at the same time:

```
sage: b.parent()
Ore Polynomial Ring in y over Univariate Polynomial Ring in t over Integer
Ring
twisted by t |--> t + 1
```

```
>>> from sage.all import *
>>> b.parent()
Ore Polynomial Ring in y over Univariate Polynomial Ring in t over Integer
Ring
twisted by t |--> t + 1
```

### `coefficients(sparse=True)`

Return the coefficients of the monomials appearing in `self`.

If `sparse=True` (the default), return only the nonzero coefficients. Otherwise, return the same value as `self.list()`.

#### Note

This should be overridden in subclasses.

### EXAMPLES:

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = 1 + x^4 + (t+1)*x^2 + t^2
sage: a.coefficients()
[t^2 + 1, t + 1, 1]
sage: a.coefficients(sparse=False)
[t^2 + 1, 0, t + 1, 0, 1]
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = Integer(1) + x**Integer(4) + (t+Integer(1))*x**Integer(2) +
... t**Integer(2)
>>> a.coefficients()
[t^2 + 1, t + 1, 1]
```

(continues on next page)

(continued from previous page)

```
>>> a.coefficients(sparse=False)
[t^2 + 1, 0, t + 1, 0, 1]
```

**constant\_coefficient()**

Return the constant coefficient (i.e., the coefficient of term of degree 0) of `self`.

EXAMPLES:

```
sage: R.<t> = ZZ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = x + t^2 + 2
sage: a.constant_coefficient()
t^2 + 2
```

```
>>> from sage.all import *
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = x + t**Integer(2) + Integer(2)
>>> a.constant_coefficient()
t^2 + 2
```

**degree()**

Return the degree of `self`.

By convention, the zero Ore polynomial has degree  $-1$ .

EXAMPLES:

```
sage: R.<t> = ZZ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = x^2 + t*x^3 + t^2*x + 1
sage: a.degree()
3
sage: S.zero().degree()
-1
sage: S(5).degree()
0
```

```
>>> from sage.all import *
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = x**Integer(2) + t*x**Integer(3) + t**Integer(2)*x + Integer(1)
>>> a.degree()
3
>>> S.zero().degree()
-1
>>> S(Integer(5)).degree()
0
```

**exponents ()**

Return the exponents of the monomials appearing in `self`.

EXAMPLES:

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = 1 + x^4 + (t+1)*x^2 + t^2
sage: a.exponents()
[0, 2, 4]
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = Integer(1) + x**Integer(4) + (t+Integer(1))*x**Integer(2) +_
>>> t**Integer(2)
>>> a.exponents()
[0, 2, 4]
```

**hamming\_weight ()**

Return the number of nonzero coefficients of `self`.

This is also known as the weight, hamming weight or sparsity.

EXAMPLES:

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = 1 + x^4 + (t+1)*x^2 + t^2
sage: a.number_of_terms()
3
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = Integer(1) + x**Integer(4) + (t+Integer(1))*x**Integer(2) +_
>>> t**Integer(2)
>>> a.number_of_terms()
3
```

This is also an alias for `hamming_weight`:

```
sage: a.hamming_weight()
3
```

```
>>> from sage.all import *
>>> a.hamming_weight()
3
```

**is\_constant ()**

Return whether `self` is a constant polynomial.

## EXAMPLES:

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: R(2).is_constant()
True
sage: (x + 1).is_constant()
False
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> R(Integer(2)).is_constant()
True
>>> (x + Integer(1)).is_constant()
False
```

**is\_left\_divisible\_by(other)**

Check if `self` is divisible by `other` on the left.

## INPUT:

- `other` – an Ore polynomial in the same ring as `self`

## OUTPUT: boolean

## EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = x^2 + t*x + t^2 + 3
sage: b = x^3 + (t + 1)*x^2 + 1
sage: c = a*b
sage: c.is_left_divisible_by(a)
True
sage: c.is_left_divisible_by(b)
False
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='t,); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = x**Integer(2) + t*x + t**Integer(2) + Integer(3)
>>> b = x**Integer(3) + (t + Integer(1))*x**Integer(2) + Integer(1)
>>> c = a*b
>>> c.is_left_divisible_by(a)
True
>>> c.is_left_divisible_by(b)
False
```

Divisibility by 0 does not make sense:

```
sage: c.is_left_divisible_by(S(0))
˓needs sage.rings.finite_rings
Traceback (most recent call last):
...
ZeroDivisionError: division by zero is not valid
```

```
>>> from sage.all import *
>>> c.is_left_divisible_by(S(Integer(0)))
˓needs sage.rings.finite_rings
Traceback (most recent call last):
...
ZeroDivisionError: division by zero is not valid
```

**is\_monic()**

Return True if this Ore polynomial is monic.

The zero polynomial is by definition not monic.

**EXAMPLES:**

```
sage: R.<t> = ZZ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = x + t
sage: a.is_monic()
True
sage: a = 0*x
sage: a.is_monic()
False
sage: a = t*x^3 + x^4 + (t+1)*x^2
sage: a.is_monic()
True
sage: a = (t^2 + 2*t)*x^2 + x^3 + t^10*x^5
sage: a.is_monic()
False
```

```
>>> from sage.all import *
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = x + t
>>> a.is_monic()
True
>>> a = Integer(0)*x
>>> a.is_monic()
False
>>> a = t*x**Integer(3) + x**Integer(4) + (t+Integer(1))*x**Integer(2)
>>> a.is_monic()
True
>>> a = (t**Integer(2) + Integer(2)*t)*x**Integer(2) + x**Integer(3) + t**Integer(10)*x**Integer(5)
>>> a.is_monic()
False
```

**is\_monomial()**

Return `True` if `self` is a monomial, i.e., a power of the generator.

EXAMPLES:

```
sage: R.<t> = ZZ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: x.is_monomial()
True
sage: (x+1).is_monomial()
False
sage: (x^2).is_monomial()
True
sage: S(1).is_monomial()
True
```

```
>>> from sage.all import *
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> x.is_monomial()
True
>>> (x+Integer(1)).is_monomial()
False
>>> (x**Integer(2)).is_monomial()
True
>>> S(Integer(1)).is_monomial()
True
```

The coefficient must be 1:

```
sage: (2*x^5).is_monomial()
False
sage: S(t).is_monomial()
False
```

```
>>> from sage.all import *
>>> (Integer(2)*x**Integer(5)).is_monomial()
False
>>> S(t).is_monomial()
False
```

To allow a non-1 leading coefficient, use `is_term()`:

```
sage: (2*x^5).is_term()
True
sage: S(t).is_term()
True
```

```
>>> from sage.all import *
>>> (Integer(2)*x**Integer(5)).is_term()
True
```

(continues on next page)

(continued from previous page)

```
>>> S(t).is_term()
True
```

**is\_nilpotent()**

Check if `self` is nilpotent.

**Note**

The paper “Nilpotents and units in skew polynomial rings over commutative rings” by M. Rimmer and K.R. Pearson describes a method to check whether a given skew polynomial is nilpotent. That method however, requires one to know the order of the automorphism which is not available in Sage. This method is thus not yet implemented.

**EXAMPLES:**

```
sage: R.<t> = ZZ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: x.is_nilpotent()
Traceback (most recent call last):
...
NotImplementedError
```

```
>>> from sage.all import *
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> x.is_nilpotent()
Traceback (most recent call last):
...
NotImplementedError
```

**is\_one()**

Test whether this polynomial is 1.

**EXAMPLES:**

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: R(1).is_one()
True
sage: (x + 3).is_one()
False
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> R(Integer(1)).is_one()
True
```

(continues on next page)

(continued from previous page)

```
>>> (x + Integer(3)).is_one()
False
```

**is\_right\_divisible\_by(other)**Check if `self` is divisible by `other` on the right.

INPUT:

- `other` – an Ore polynomial in the same ring as `self`

OUTPUT: boolean

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = x^2 + t*x + t^2 + 3
sage: b = x^3 + (t + 1)*x^2 + 1
sage: c = a*b
sage: c.is_right_divisible_by(a)
False
sage: c.is_right_divisible_by(b)
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = x**Integer(2) + t*x + t**Integer(2) + Integer(3)
>>> b = x**Integer(3) + (t + Integer(1))*x**Integer(2) + Integer(1)
>>> c = a*b
>>> c.is_right_divisible_by(a)
False
>>> c.is_right_divisible_by(b)
True
```

Divisibility by 0 does not make sense:

```
sage: c.is_right_divisible_by(S(0))
# needs sage.rings.finite_rings
Traceback (most recent call last):
...
ZeroDivisionError: division by zero is not valid
```

```
>>> from sage.all import *
>>> c.is_right_divisible_by(S(Integer(0)))
# needs sage.rings.finite_rings
Traceback (most recent call last):
...
ZeroDivisionError: division by zero is not valid
```

This function does not work if the leading coefficient of the divisor is not a unit:

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = x^2 + 2*x + t
sage: b = (t+1)*x + t^2
sage: c = a*b
sage: c.is_right_divisible_by(b)
Traceback (most recent call last):
...
NotImplementedError: the leading coefficient of the divisor is not invertible
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = x**Integer(2) + Integer(2)*x + t
>>> b = (t+Integer(1))*x + t**Integer(2)
>>> c = a*b
>>> c.is_right_divisible_by(b)
Traceback (most recent call last):
...
NotImplementedError: the leading coefficient of the divisor is not invertible
```

### `is_term()`

Return `True` if `self` is an element of the base ring times a power of the generator.

EXAMPLES:

```
sage: R.<t> = ZZ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: x.is_term()
True
sage: R(1).is_term()
True
sage: (3*x^5).is_term()
True
sage: (1+3*x^5).is_term()
False
```

```
>>> from sage.all import *
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> x.is_term()
True
>>> R(Integer(1)).is_term()
True
>>> (Integer(3)*x**Integer(5)).is_term()
True
>>> (Integer(1)+Integer(3)*x**Integer(5)).is_term()
False
```

If you want to test that `self` also has leading coefficient 1, use `is_monomial()` instead:

```
sage: (3*x^5).is_monomial()
False
```

```
>>> from sage.all import *
>>> (Integer(3)*x**Integer(5)).is_monomial()
False
```

### `is_unit()`

Return `True` if this Ore polynomial is a unit.

When the base ring  $R$  is an integral domain, then an Ore polynomial  $f$  is a unit if and only if degree of  $f$  is 0 and  $f$  is then a unit in  $R$ .

#### Note

The case when  $R$  is not an integral domain is not yet implemented.

### EXAMPLES:

```
sage: R.<t> = ZZ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = x + (t+1)*x^5 + t^2*x^3 - x^5
sage: a.is_unit()
False
```

```
>>> from sage.all import *
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = x + (t+Integer(1))*x**Integer(5) + t**Integer(2)*x**Integer(3) -_
>>> x**Integer(5)
>>> a.is_unit()
False
```

### `is_zero()`

Return `True` if `self` is the zero polynomial.

### EXAMPLES:

```
sage: R.<t> = ZZ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = x + 1
sage: a.is_zero()
False
sage: b = S.zero()
sage: b.is_zero()
True
```

```
>>> from sage.all import *
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = x + Integer(1)
>>> a.is_zero()
False
>>> b = S.zero()
>>> b.is_zero()
True
```

**leading\_coefficient()**

Return the coefficient of the highest-degree monomial of `self`.

**EXAMPLES:**

```
sage: R.<t> = ZZ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = (t+1)*x^5 + t^2*x^3 + x
sage: a.leading_coefficient()
t + 1
```

```
>>> from sage.all import *
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = (t+Integer(1))*x**Integer(5) + t**Integer(2)*x**Integer(3) + x
>>> a.leading_coefficient()
t + 1
```

By convention, the leading coefficient to the zero polynomial is zero:

```
sage: S(0).leading_coefficient()
0
```

```
>>> from sage.all import *
>>> S(Integer(0)).leading_coefficient()
0
```

**left\_divides (other)**

Check if `self` divides `other` on the left.

**INPUT:**

- `other` – an Ore polynomial in the same ring as `self`

**OUTPUT:** boolean**EXAMPLES:**

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
```

(continues on next page)

(continued from previous page)

```
sage: a = x^2 + t*x + t^2 + 3
sage: b = x^3 + (t + 1)*x^2 + 1
sage: c = a * b
sage: a.left_divides(c)
True
sage: b.left_divides(c)
False
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='t,); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = x**Integer(2) + t*x + t**Integer(2) + Integer(3)
>>> b = x**Integer(3) + (t + Integer(1))*x**Integer(2) + Integer(1)
>>> c = a * b
>>> a.left_divides(c)
True
>>> b.left_divides(c)
False
```

Divisibility by 0 does not make sense:

```
sage: S(0).left_divides(c) #_
→needs sage.rings.finite_rings
Traceback (most recent call last):
...
ZeroDivisionError: division by zero is not valid
```

```
>>> from sage.all import *
>>> S(Integer(0)).left_divides(c) #_
→    # needs sage.rings.finite_rings
Traceback (most recent call last):
...
ZeroDivisionError: division by zero is not valid
```

### `left_gcd(other, monic=True)`

Return the left gcd of `self` and `other`.

INPUT:

- `other` – an Ore polynomial in the same ring as `self`
- `monic` – boolean (default: `True`); return whether the left gcd should be normalized to be monic

OUTPUT:

The left gcd of `self` and `other`, that is an Ore polynomial  $g$  with the following property: any Ore polynomial is divisible on the left by  $g$  iff it is divisible on the left by both `self` and `other`. If `monic` is `True`,  $g$  is in addition monic. (With this extra condition, it is uniquely determined.)

#### Note

Works only if following two conditions are fulfilled (otherwise left gcd do not exist in general): 1) the base ring is a field and 2) the twisting morphism is bijective.

## EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = (x + t) * (x^2 + t*x + 1)
sage: b = 2 * (x + t) * (x^3 + (t+1)*x^2 + t^2)
sage: a.left_gcd(b)
x + t
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='t,); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = (x + t) * (x**Integer(2) + t*x + Integer(1))
>>> b = Integer(2) * (x + t) * (x**Integer(3) + (t+Integer(1))*x**Integer(2)-
>>> t**Integer(2))
>>> a.left_gcd(b)
x + t
```

Specifying `monic=False`, we *can* get a nonmonic gcd:

```
sage: a.left_gcd(b,monic=False)
#_
˓needs sage.rings.finite_rings
2*t*x + 4*t + 2
```

```
>>> from sage.all import *
>>> a.left_gcd(b,monic=False)
#_
˓needs sage.rings.finite_rings
2*t*x + 4*t + 2
```

The base ring needs to be a field:

```
sage: # needs sage.rings.finite_rings
sage: R.<t> = QQ[]
sage: sigma = R.hom([t + 1])
sage: S.<x> = R['x',sigma]
sage: a = (x + t) * (x^2 + t*x + 1)
sage: b = 2 * (x + t) * (x^3 + (t+1)*x^2 + t^2)
sage: a.left_gcd(b)
Traceback (most recent call last):
...
TypeError: the base ring must be a field
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> R = QQ['t']; (t,) = R._first_ngens(1)
```

(continues on next page)

(continued from previous page)

```
>>> sigma = R.hom([t + Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = (x + t) * (x**Integer(2) + t*x + Integer(1))
>>> b = Integer(2) * (x + t) * (x**Integer(3) + (t+Integer(1))*x**Integer(2) +
...+ t**Integer(2))
>>> a.left_gcd(b)
Traceback (most recent call last):
...
TypeError: the base ring must be a field
```

And the twisting morphism needs to be bijective:

```
sage: # needs sage.rings.finite_rings
sage: FR = R.fraction_field()
sage: f = FR.hom([FR(t)^2])
sage: S.<x> = FR['x',f]
sage: a = (x + t) * (x^2 + t*x + 1)
sage: b = 2 * (x + t) * (x^3 + (t+1)*x^2 + t^2)
sage: a.left_gcd(b)
Traceback (most recent call last):
...
NotImplementedError: inversion of the twisting morphism Ring endomorphism
of Fraction Field of Univariate Polynomial Ring in t over Rational Field
Defn: t |--> t^2
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> FR = R.fraction_field()
>>> f = FR.hom([FR(t)**Integer(2)])
>>> S = FR['x',f]; (x,) = S._first_ngens(1)
>>> a = (x + t) * (x**Integer(2) + t*x + Integer(1))
>>> b = Integer(2) * (x + t) * (x**Integer(3) + (t+Integer(1))*x**Integer(2) +
...+ t**Integer(2))
>>> a.left_gcd(b)
Traceback (most recent call last):

Defn: t |--> t^2
```

### `left_lcm(other, monic=True)`

Return the left lcm of `self` and `other`.

#### INPUT:

- `other` – an Ore polynomial in the same ring as `self`
- `monic` – boolean (default: `True`); return whether the left lcm should be normalized to be monic

#### OUTPUT:

The left lcm of `self` and `other`, that is an Ore polynomial  $l$  with the following property: any Ore polynomial is a left multiple of  $l$  (right divisible by  $l$ ) iff it is a left multiple of both `self` and `other` (right divisible by `self` and `other`). If `monic` is `True`,  $l$  is in addition monic. (With this extra condition, it is uniquely determined.)

**Note**

Works only if the base ring is a field (otherwise left lcm do not exist in general).

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = (x + t^2) * (x + t)
sage: b = 2 * (x^2 + t + 1) * (x * t)
sage: c = a.left_lcm(b); c
x^5 + (2*t^2 + t + 4)*x^4 + (3*t^2 + 4)*x^3 + (3*t^2 + 3*t + 2)*x^2 + (t^2 + t + 2)*x
sage: c.is_right_divisible_by(a)
True
sage: c.is_right_divisible_by(b)
True
sage: a.degree() + b.degree() == c.degree() + a.right_gcd(b).degree()
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = (x + t**Integer(2)) * (x + t)
>>> b = Integer(2) * (x**Integer(2) + t + Integer(1)) * (x * t)
>>> c = a.left_lcm(b); c
x^5 + (2*t^2 + t + 4)*x^4 + (3*t^2 + 4)*x^3 + (3*t^2 + 3*t + 2)*x^2 + (t^2 + t + 2)*x
>>> c.is_right_divisible_by(a)
True
>>> c.is_right_divisible_by(b)
True
>>> a.degree() + b.degree() == c.degree() + a.right_gcd(b).degree()
True
```

Specifying `monic=False`, we *can* get a nonmonic lcm:

```
sage: a.left_lcm(b,monic=False) #_
<needs sage.rings.finite_rings
(t^2 + t)*x^5 + (4*t^2 + 4*t + 1)*x^4 + (t + 1)*x^3 + (t^2 + 2)*x^2 + (3*t + 4)*x
```

```
>>> from sage.all import *
>>> a.left_lcm(b,monic=False) #_
<needs sage.rings.finite_rings
(t^2 + t)*x^5 + (4*t^2 + 4*t + 1)*x^4 + (t + 1)*x^3 + (t^2 + 2)*x^2 + (3*t + 4)*x
```

The base ring needs to be a field:

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = (x + t^2) * (x + t)
sage: b = 2 * (x^2 + t + 1) * (x * t)
sage: a.left_lcm(b)
Traceback (most recent call last):
...
TypeError: the base ring must be a field
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = (x + t**Integer(2)) * (x + t)
>>> b = Integer(2) * (x**Integer(2) + t + Integer(1)) * (x * t)
>>> a.left_lcm(b)
Traceback (most recent call last):
...
TypeError: the base ring must be a field
```

**left\_mod(*other*)**

Return the remainder of left division of *self* by *other*.

## EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = 1 + t*x^2
sage: b = x + 1
sage: a.left_mod(b)
2*t^2 + 4*t
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='t,); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = Integer(1) + t*x**Integer(2)
>>> b = x + Integer(1)
>>> a.left_mod(b)
2*t^2 + 4*t
```

**left\_monic()**

Return the unique monic Ore polynomial *m* which divides this polynomial on the left and has the same degree.

Given an Ore polynomial *P* of degree *n*, its left monic is given by  $P \cdot \sigma^{-n}(1/k)$ , where *k* is the leading coefficient of *P* and  $\sigma$  is the twisting morphism.

## EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = (3*t^2 + 3*t + 2)*x^3 + (2*t^2 + 3)*x^2 + (4*t^2 + t + 4)*x + 2*t^2 +
    ↪+ 2
sage: b = a.left_monic(); b
x^3 + (4*t^2 + 3*t)*x^2 + (4*t + 2)*x + 2*t^2 + 4*t + 3
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='t,); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = (Integer(3)*t**Integer(2) + Integer(3)*t + Integer(2))*x**Integer(3) +
    ↪+ (Integer(2)*t**Integer(2) + Integer(3))*x**Integer(2) +
    ↪(Integer(4)*t**Integer(2) + t + Integer(4))*x + Integer(2)*t**Integer(2) +
    ↪Integer(2)
>>> b = a.left_monic(); b
x^3 + (4*t^2 + 3*t)*x^2 + (4*t + 2)*x + 2*t^2 + 4*t + 3
```

Check list:

```
sage: # needs sage.rings.finite_rings
sage: b.degree() == a.degree()
True
sage: a.is_left_divisible_by(b)
True
sage: twist = S.twisting_morphism(-a.degree())
sage: a == b * twist(a.leading_coefficient())
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> b.degree() == a.degree()
True
>>> a.is_left_divisible_by(b)
True
>>> twist = S.twisting_morphism(-a.degree())
>>> a == b * twist(a.leading_coefficient())
True
```

Note that  $b$  does not divide  $a$  on the right:

```
sage: a.is_right_divisible_by(b) #_
    ↪needs sage.rings.finite_rings
False
```

```
>>> from sage.all import *
>>> a.is_right_divisible_by(b) #_
    ↪needs sage.rings.finite_rings
False
```

This function does not work if the leading coefficient is not a unit:

```
sage: R.<t> = QQ[]
sage: der = R.derivation()
sage: S.<x> = R['x', der]
sage: a = t*x
sage: a.left_monic()
Traceback (most recent call last):
...
NotImplementedError: the leading coefficient is not a unit
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> der = R.derivation()
>>> S = R['x', der]; (x,) = S._first_ngens(1)
>>> a = t*x
>>> a.left_monic()
Traceback (most recent call last):
...
NotImplementedError: the leading coefficient is not a unit
```

### `left_quo_rem(other)`

Return the quotient and remainder of the left Euclidean division of `self` by `other`.

INPUT:

- `other` – an Ore polynomial in the same ring as `self`

OUTPUT:

- the quotient and the remainder of the left Euclidean division of this Ore polynomial by `other`

#### Note

This will fail if the leading coefficient of `other` is not a unit or if Sage can't invert the twisting morphism.

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = (3*t^2 + 3*t + 2)*x^3 + (2*t^2 + 3)*x^2 + (4*t^2 + t + 4)*x + 2*t^2 - 2
sage: b = (3*t^2 + 4*t + 2)*x^2 + (2*t^2 + 4*t + 3)*x + 2*t^2 + t + 1
sage: q,r = a.left_quo_rem(b)
sage: a == b*q + r
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='t,); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
```

(continues on next page)

(continued from previous page)

```
>>> a = (Integer(3)*t**Integer(2) + Integer(3)*t + Integer(2))*x**Integer(3) +
    <+ (Integer(2)*t**Integer(2) + Integer(3))*x**Integer(2) +
    <+ (Integer(4)*t**Integer(2) + t + Integer(4))*x + Integer(2)*t**Integer(2) +
    <+ Integer(2)
>>> b = (Integer(3)*t**Integer(2) + Integer(4)*t + Integer(2))*x**Integer(2) +
    <+ (Integer(2)*t**Integer(2) + Integer(4)*t + Integer(3))*x +
    <+ Integer(2)*t**Integer(2) + t + Integer(1)
>>> q,r = a.left_quo_rem(b)
>>> a == b*q + r
True
```

In the following example, Sage does not know the inverse of the twisting morphism:

```
sage: R.<t> = QQ[]
sage: K = R.fraction_field()
sage: sigma = K.hom([(t+1)/(t-1)])
sage: S.<x> = K['x',sigma]
sage: a = (-2*t^2 - t + 1)*x^3 + (-t^2 + t)*x^2 + (-12*t - 2)*x - t^2 - 95*t -
    <+ 1
sage: b = x^2 + (5*t - 6)*x - 4*t^2 + 4*t - 1
sage: a.left_quo_rem(b)
Traceback (most recent call last):
...
NotImplementedError: inversion of the twisting morphism Ring endomorphism of
    <Fraction Field of Univariate Polynomial Ring in t over Rational Field
    Defn: t |--> (t + 1)/(t - 1)
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> K = R.fraction_field()
>>> sigma = K.hom([(t+Integer(1))/(t-Integer(1))])
>>> S = K['x',sigma]; (x,) = S._first_ngens(1)
>>> a = (-Integer(2)*t**Integer(2) - t + Integer(1))*x**Integer(3) + (-
    <+ t**Integer(2) + t)*x**Integer(2) + (-Integer(12)*t - Integer(2))*x -
    <+ t**Integer(2) - Integer(95)*t + Integer(1)
>>> b = x**Integer(2) + (Integer(5)*t - Integer(6))*x -
    <+ Integer(4)*t**Integer(2) + Integer(4)*t - Integer(1)
>>> a.left_quo_rem(b)
Traceback (most recent call last):
...
NotImplementedError: inversion of the twisting morphism Ring endomorphism of
    <Fraction Field of Univariate Polynomial Ring in t over Rational Field
    Defn: t |--> (t + 1)/(t - 1)
```

### **left\_xgcd(other, monic=True)**

Return the left gcd of `self` and `other` along with the coefficients for the linear combination.

If `a` is `self` and `b` is `other`, then there are Ore polynomials `u` and `v` such that  $g = au + bv$ , where `g` is the left gcd of `a` and `b`. This method returns  $(g, u, v)$ .

INPUT:

- `other` – an Ore polynomial in the same ring as `self`
- `monic` – boolean (default: `True`); return whether the left gcd should be normalized to be monic

## OUTPUT:

- The left gcd of `self` and `other`, that is an Ore polynomial  $g$  with the following property: any Ore polynomial is divisible on the left by  $g$  iff it is divisible on the left by both `self` and `other`. If `monic` is `True`,  $g$  is in addition monic. (With this extra condition, it is uniquely determined.)
- Two Ore polynomials  $u$  and  $v$  such that:

$$g = s \cdot u + b \cdot v,$$

where  $s$  is `self` and  $b$  is `other`.

**Note**

Works only if following two conditions are fulfilled (otherwise left gcd do not exist in general): 1) the base ring is a field and 2) the twisting morphism is bijective.

## EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = (x + t) * (x^2 + t*x + 1)
sage: b = 2 * (x + t) * (x^3 + (t+1)*x^2 + t^2)
sage: g,u,v = a.left_xgcd(b); g
x + t
sage: a*u + b*v == g
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = (x + t) * (x**Integer(2) + t*x + Integer(1))
>>> b = Integer(2) * (x + t) * (x**Integer(3) + (t+Integer(1))*x**Integer(2) -
>+ t**Integer(2))
>>> g,u,v = a.left_xgcd(b); g
x + t
>>> a*u + b*v == g
True
```

Specifying `monic=False`, we can get a nonmonic gcd:

```
sage: g,u,v = a.left_xgcd(b, monic=False); g
#_
˓needs sage.rings.finite_rings
2*t*x + 4*t + 2
sage: a*u + b*v == g
#_
˓needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> g,u,v = a.left_xgcd(b, monic=False); g
# needs sage.rings.finite_rings
2*t*x + 4*t + 2
>>> a*u + b*v == g
# needs sage.rings.finite_rings
True
```

The base ring must be a field:

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = (x + t) * (x^2 + t*x + 1)
sage: b = 2 * (x + t) * (x^3 + (t+1)*x^2 + t^2)
sage: a.left_xgcd(b)
Traceback (most recent call last):
...
TypeError: the base ring must be a field
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = (x + t) * (x**Integer(2) + t*x + Integer(1))
>>> b = Integer(2) * (x + t) * (x**Integer(3) + (t+Integer(1))*x**Integer(2) +
# + t**Integer(2))
>>> a.left_xgcd(b)
Traceback (most recent call last):
...
TypeError: the base ring must be a field
```

And the twisting morphism must be bijective:

```
sage: FR = R.fraction_field()
sage: f = FR.hom([FR(t)^2])
sage: S.<x> = FR['x',f]
sage: a = (x + t) * (x^2 + t*x + 1)
sage: b = 2 * (x + t) * (x^3 + (t+1)*x^2 + t^2)
sage: a.left_xgcd(b)
Traceback (most recent call last):
...
NotImplementedError: inversion of the twisting morphism Ring endomorphism of #
# Fraction Field of Univariate Polynomial Ring in t over Rational Field
Defn: t |--> t^2
```

```
>>> from sage.all import *
>>> FR = R.fraction_field()
>>> f = FR.hom([FR(t)**Integer(2)])
>>> S = FR['x',f]; (x,) = S._first_ngens(1)
>>> a = (x + t) * (x**Integer(2) + t*x + Integer(1))
>>> b = Integer(2) * (x + t) * (x**Integer(3) + (t+Integer(1))*x**Integer(2) +
# + t**Integer(2))
```

(continues on next page)

(continued from previous page)

```
>>> a.left_xgcd(b)
Traceback (most recent call last):
...
NotImplementedError: inversion of the twisting morphism Ring endomorphism of 
→Fraction Field of Univariate Polynomial Ring in t over Rational Field
Defn: t |--> t^2
```

**left\_xlcm(*other*, *monic=True*)**Return the left lcm  $L$  of *self* and *other* together with two Ore polynomials  $U$  and  $V$  such that

$$U \cdot \text{self} = V \cdot \text{other} = L.$$

**EXAMPLES:**

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: P = (x + t^2) * (x + t)
sage: Q = 2 * (x^2 + t + 1) * (x * t)
sage: L, U, V = P.left_xlcm(Q)
sage: L
x^5 + (2*t^2 + t + 4)*x^4 + (3*t^2 + 4)*x^3 + (3*t^2 + 3*t + 2)*x^2 + (t^2 + 
→t + 2)*x

sage: U * P == L
#_
→needs sage.rings.finite_rings
True
sage: V * Q == L
#_
→needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> P = (x + t**Integer(2)) * (x + t)
>>> Q = Integer(2) * (x**Integer(2) + t + Integer(1)) * (x * t)
>>> L, U, V = P.left_xlcm(Q)
>>> L
x^5 + (2*t^2 + t + 4)*x^4 + (3*t^2 + 4)*x^3 + (3*t^2 + 3*t + 2)*x^2 + (t^2 + 
→t + 2)*x

>>> U * P == L
#_
→needs sage.rings.finite_rings
True
>>> V * Q == L
#_
→needs sage.rings.finite_rings
True
```

**number\_of\_terms()**Return the number of nonzero coefficients of *self*.

This is also known as the weight, hamming weight or sparsity.

EXAMPLES:

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = 1 + x^4 + (t+1)*x^2 + t^2
sage: a.number_of_terms()
3
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = Integer(1) + x**Integer(4) + (t+Integer(1))*x**Integer(2) +_
... t**Integer(2)
>>> a.number_of_terms()
3
```

This is also an alias for hamming\_weight:

```
sage: a.hamming_weight()
3
```

```
>>> from sage.all import *
>>> a.hamming_weight()
3
```

### padded\_list (n=None)

Return list of coefficients of self up to (but not including) degree n.

Includes 0`sin the list on the right so that the list always has length exactly `n.

INPUT:

- n – (default: None) if given, an integer that is at least 0

EXAMPLES:

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = 1 + t*x^3 + t^2*x^5
sage: a.padded_list()
[1, 0, 0, t, 0, t^2]
sage: a.padded_list(10)
[1, 0, 0, t, 0, t^2, 0, 0, 0, 0]
sage: len(a.padded_list(10))
10
sage: a.padded_list(3)
[1, 0, 0]
sage: a.padded_list(0)
[]
sage: a.padded_list(-1)
```

(continues on next page)

(continued from previous page)

```
Traceback (most recent call last):
...
ValueError: n must be at least 0
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = Integer(1) + t*x**Integer(3) + t**Integer(2)*x**Integer(5)
>>> a.padded_list()
[1, 0, 0, t, 0, t^2]
>>> a.padded_list(Integer(10))
[1, 0, 0, t, 0, t^2, 0, 0, 0, 0]
>>> len(a.padded_list(Integer(10)))
10
>>> a.padded_list(Integer(3))
[1, 0, 0]
>>> a.padded_list(Integer(0))
[]
>>> a.padded_list(-Integer(1))
Traceback (most recent call last):
...
ValueError: n must be at least 0
```

**prec()**

Return the precision of `self`.

This is always infinity, since polynomials are of infinite precision by definition (there is no big-oh).

**EXAMPLES:**

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: x.prec()
+Infinity
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> x.prec()
+Infinity
```

**right\_divides(other)**

Check if `self` divides `other` on the right.

**INPUT:**

- `other` – an Ore polynomial in the same ring as `self`

**OUTPUT:** boolean

**EXAMPLES:**

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = x^2 + t*x + t^2 + 3
sage: b = x^3 + (t + 1)*x^2 + 1
sage: c = a * b
sage: a.right_divides(c)
False
sage: b.right_divides(c)
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='t,); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = x**Integer(2) + t*x + t**Integer(2) + Integer(3)
>>> b = x**Integer(3) + (t + Integer(1))*x**Integer(2) + Integer(1)
>>> c = a * b
>>> a.right_divides(c)
False
>>> b.right_divides(c)
True
```

Divisibility by 0 does not make sense:

```
sage: S(0).right_divides(c)
# needs sage.rings.finite_rings
Traceback (most recent call last):
...
ZeroDivisionError: division by zero is not valid
```

```
>>> from sage.all import *
>>> S(Integer(0)).right_divides(c)
# needs sage.rings.finite_rings
Traceback (most recent call last):
...
ZeroDivisionError: division by zero is not valid
```

This function does not work if the leading coefficient of the divisor is not a unit:

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = x^2 + 2*x + t
sage: b = (t+1)*x + t^2
sage: c = a*b
sage: b.right_divides(c)
Traceback (most recent call last):
...
NotImplementedError: the leading coefficient of the divisor is not invertible
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = x**Integer(2) + Integer(2)*x + t
>>> b = (t+Integer(1))*x + t**Integer(2)
>>> c = a*b
>>> b.right_divides(c)
Traceback (most recent call last):
...
NotImplementedError: the leading coefficient of the divisor is not invertible
```

**right\_gcd(other, monic=True)**

Return the right gcd of `self` and `other`.

**INPUT:**

- `other` – an Ore polynomial in the same ring as `self`
- `monic` – boolean (default: `True`); return whether the right gcd should be normalized to be monic

**OUTPUT:**

The right gcd of `self` and `other`, that is an Ore polynomial  $g$  with the following property: any Ore polynomial is divisible on the right by  $g$  iff it is divisible on the right by both `self` and `other`. If `monic` is `True`,  $g$  is in addition monic. (With this extra condition, it is uniquely determined.)

**Note**

Works only if the base ring is a field (otherwise right gcd do not exist in general).

**EXAMPLES:**

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = (x^2 + t*x + 1) * (x + t)
sage: b = 2 * (x^3 + (t+1)*x^2 + t^2) * (x + t)
sage: a.right_gcd(b)
x + t
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='t,); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = (x**Integer(2) + t*x + Integer(1)) * (x + t)
>>> b = Integer(2) * (x**Integer(3) + (t+Integer(1))*x**Integer(2) +_
<--t**Integer(2)) * (x + t)
>>> a.right_gcd(b)
x + t
```

Specifying `monic=False`, we *can* get a nonmonic gcd:

```
sage: a.right_gcd(b,monic=False)
˓needs sage.rings.finite_rings
(4*t^2 + 4*t + 1)*x + 4*t^2 + 4*t + 3
```

```
>>> from sage.all import *
>>> a.right_gcd(b,monic=False)
˓needs sage.rings.finite_rings
(4*t^2 + 4*t + 1)*x + 4*t^2 + 4*t + 3
```

The base ring need to be a field:

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = (x^2 + t*x + 1) * (x + t)
sage: b = 2 * (x^3 + (t+1)*x^2 + t^2) * (x + t)
sage: a.right_gcd(b)
Traceback (most recent call last):
...
TypeError: the base ring must be a field
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = (x**Integer(2) + t*x + Integer(1)) * (x + t)
>>> b = Integer(2) * (x**Integer(3) + (t+Integer(1))*x**Integer(2) +_
˓t**Integer(2)) * (x + t)
>>> a.right_gcd(b)
Traceback (most recent call last):
...
TypeError: the base ring must be a field
```

### `right_lcm(other, monic=True)`

Return the right lcm of `self` and `other`.

INPUT:

- `other` – an Ore polynomial in the same ring as `self`
- `monic` – boolean (default: `True`); return whether the right lcm should be normalized to be monic

OUTPUT:

The right lcm of `self` and `other`, that is an Ore polynomial  $l$  with the following property: any Ore polynomial is a right multiple of  $g$  (left divisible by  $l$ ) iff it is a right multiple of both `self` and `other` (left divisible by `self` and `other`). If `monic` is `True`,  $g$  is in addition monic. (With this extra condition, it is uniquely determined.)

#### Note

Works only if two following conditions are fulfilled (otherwise right lcm do not exist in general): 1) the base ring is a field and 2) the twisting morphism on this field is bijective.

## EXAMPLES:

```

sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = (x + t) * (x + t^2)
sage: b = 2 * (x + t) * (x^2 + t + 1)
sage: c = a.right_lcm(b); c
x^4 + (2*t^2 + t + 2)*x^3 + (3*t^2 + 4*t + 1)*x^2 + (3*t^2 + 4*t + 1)*x + t^2 #
→+ 4
sage: c.is_left_divisible_by(a)
True
sage: c.is_left_divisible_by(b)
True
sage: a.degree() + b.degree() == c.degree() + a.left_gcd(b).degree()
True

```

```

>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='t,); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = (x + t) * (x + t**Integer(2))
>>> b = Integer(2) * (x + t) * (x**Integer(2) + t + Integer(1))
>>> c = a.right_lcm(b); c
x^4 + (2*t^2 + t + 2)*x^3 + (3*t^2 + 4*t + 1)*x^2 + (3*t^2 + 4*t + 1)*x + t^2 #
→+ 4
>>> c.is_left_divisible_by(a)
True
>>> c.is_left_divisible_by(b)
True
>>> a.degree() + b.degree() == c.degree() + a.left_gcd(b).degree()
True

```

Specifying `monic=False`, we *can* get a nonmonic gcd:

```

sage: a.right_lcm(b,monic=False) #_
→needs sage.rings.finite_rings
2*t*x^4 + (3*t + 1)*x^3 + (4*t^2 + 4*t + 3)*x^2
+ (3*t^2 + 4*t + 2)*x + 3*t^2 + 2*t + 3

```

```

>>> from sage.all import *
>>> a.right_lcm(b,monic=False) #_
→needs sage.rings.finite_rings
2*t*x^4 + (3*t + 1)*x^3 + (4*t^2 + 4*t + 3)*x^2
+ (3*t^2 + 4*t + 2)*x + 3*t^2 + 2*t + 3

```

The base ring needs to be a field:

```

sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]

```

(continues on next page)

(continued from previous page)

```
sage: a = (x + t) * (x + t^2)
sage: b = 2 * (x + t) * (x^2 + t + 1)
sage: a.right_lcm(b)
Traceback (most recent call last):
...
TypeError: the base ring must be a field
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = (x + t) * (x + t**Integer(2))
>>> b = Integer(2) * (x + t) * (x**Integer(2) + t + Integer(1))
>>> a.right_lcm(b)
Traceback (most recent call last):
...
TypeError: the base ring must be a field
```

And the twisting morphism needs to be bijective:

```
sage: FR = R.fraction_field()
sage: f = FR.hom([FR(t)^2])
sage: S.<x> = FR['x',f]
sage: a = (x + t) * (x + t^2)
sage: b = 2 * (x + t) * (x^2 + t + 1)
sage: a.right_lcm(b)
Traceback (most recent call last):
...
NotImplementedError: inversion of the twisting morphism Ring endomorphism of
Fraction Field of Univariate Polynomial Ring in t over Rational Field
Defn: t |--> t^2
```

```
>>> from sage.all import *
>>> FR = R.fraction_field()
>>> f = FR.hom([FR(t)**Integer(2)])
>>> S = FR['x',f]; (x,) = S._first_ngens(1)
>>> a = (x + t) * (x + t**Integer(2))
>>> b = Integer(2) * (x + t) * (x**Integer(2) + t + Integer(1))
>>> a.right_lcm(b)
Traceback (most recent call last):
...
NotImplementedError: inversion of the twisting morphism Ring endomorphism of
Fraction Field of Univariate Polynomial Ring in t over Rational Field
Defn: t |--> t^2
```

### `right_mod(other)`

Return the remainder of right division of `self` by `other`.

EXAMPLES:

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
```

(continues on next page)

(continued from previous page)

```
sage: S.<x> = R['x',sigma]
sage: a = 1 + t*x^2
sage: b = x + 1
sage: a % b
t + 1
sage: (x^3 + x - 1).right_mod(x^2 - 1)
2*x - 1
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = Integer(1) + t*x**Integer(2)
>>> b = x + Integer(1)
>>> a % b
t + 1
>>> (x**Integer(3) + x - Integer(1)).right_mod(x**Integer(2) - Integer(1))
2*x - 1
```

### `right_monic()`

Return the unique monic Ore polynomial which divides this polynomial on the right and has the same degree.

Given an Ore polynomial  $P$  of degree  $n$ , its right monic is given by  $(1/k) \cdot P$ , where  $k$  is the leading coefficient of  $P$ .

### EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = (3*t^2 + 3*t + 2)*x^3 + (2*t^2 + 3)*x^2 + (4*t^2 + t + 4)*x + 2*t^2
      + 2
sage: b = a.right_monic(); b
x^3 + (2*t^2 + 3*t + 4)*x^2 + (3*t^2 + 4*t + 1)*x + 2*t^2 + 4*t + 3
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = (Integer(3)*t**Integer(2) + Integer(3)*t + Integer(2))*x**Integer(3)
      + (Integer(2)*t**Integer(2) + Integer(3))*x**Integer(2) +
      (Integer(4)*t**Integer(2) + t + Integer(4))*x + Integer(2)*t**Integer(2) +
      Integer(2)
>>> b = a.right_monic(); b
x^3 + (2*t^2 + 3*t + 4)*x^2 + (3*t^2 + 4*t + 1)*x + 2*t^2 + 4*t + 3
```

Check list:

```
sage: b.degree() == a.degree()                                     #
      # needs sage.rings.finite_rings
True
```

(continues on next page)

(continued from previous page)

```
sage: a.is_right_divisible_by(b) #_
˓needs sage.rings.finite_rings
True
sage: a == a.leading_coefficient() * b #_
˓needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> b.degree() == a.degree() #_
˓needs sage.rings.finite_rings
True
>>> a.is_right_divisible_by(b) #_
˓needs sage.rings.finite_rings
True
>>> a == a.leading_coefficient() * b #_
˓needs sage.rings.finite_rings
True
```

Note that  $b$  does not divide  $a$  on the right:

```
sage: a.is_left_divisible_by(b) #_
˓needs sage.rings.finite_rings
False
```

```
>>> from sage.all import *
>>> a.is_left_divisible_by(b) #_
˓needs sage.rings.finite_rings
False
```

This function does not work if the leading coefficient is not a unit:

```
sage: R.<t> = QQ[]
sage: der = R.derivation()
sage: S.<x> = R['x', der]
sage: a = t*x
sage: a.right_monic()
Traceback (most recent call last):
...
NotImplementedError: the leading coefficient is not a unit
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> der = R.derivation()
>>> S = R['x', der]; (x,) = S._first_ngens(1)
>>> a = t*x
>>> a.right_monic()
Traceback (most recent call last):
...
NotImplementedError: the leading coefficient is not a unit
```

### `right_quo_rem(other)`

Return the quotient and remainder of the right Euclidean division of `self` by `other`.

INPUT:

- `other` – an Ore polynomial in the same ring as `self`

OUTPUT:

- the quotient and the remainder of the right Euclidean division of this Ore polynomial by `other`

 Note

This will fail if the leading coefficient of the divisor is not a unit.

EXAMPLES:

```
sage: R.<t> = ZZ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = S.random_element(degree=4)
sage: b = S.random_element(monic=True)
sage: q,r = a.right_quo_rem(b)
sage: a == q*b + r
True
```

```
>>> from sage.all import *
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = S.random_element(degree=Integer(4))
>>> b = S.random_element(monic=True)
>>> q,r = a.right_quo_rem(b)
>>> a == q*b + r
True
```

The leading coefficient of the divisor need to be invertible:

```
sage: a.right_quo_rem(S(0))
Traceback (most recent call last):
...
ZeroDivisionError: division by zero is not valid
sage: c = S.random_element()
sage: while not c or c.leading_coefficient().is_unit():
....:     c = S.random_element()
sage: while a.degree() < c.degree():
....:     a = S.random_element(degree=4)
sage: a.right_quo_rem(c)
Traceback (most recent call last):
...
NotImplementedError: the leading coefficient of the divisor is not invertible
```

```
>>> from sage.all import *
>>> a.right_quo_rem(S(Integer(0)))
Traceback (most recent call last):
...
ZeroDivisionError: division by zero is not valid
```

(continues on next page)

(continued from previous page)

```
>>> c = S.random_element()
>>> while not c or c.leading_coefficient().is_unit():
...     c = S.random_element()
>>> while a.degree() < c.degree():
...     a = S.random_element(degree=Integer(4))
>>> a.right_quo_rem(c)
Traceback (most recent call last):
...
NotImplementedError: the leading coefficient of the divisor is not invertible
```

**right\_xgcd(*other*, *monic=True*)**

Return the right gcd of *self* and *other* along with the coefficients for the linear combination.

If *a* is *self* and *b* is *other*, then there are Ore polynomials *u* and *v* such that  $g = ua + vb$ , where *g* is the right gcd of *a* and *b*. This method returns  $(g, u, v)$ .

**INPUT:**

- *other* – an Ore polynomial in the same ring as *self*
- *monic* – boolean (default: `True`); return whether the right gcd should be normalized to be monic

**OUTPUT:**

- The right gcd of *self* and *other*, that is an Ore polynomial *g* with the following property: any Ore polynomial is divisible on the right by *g* iff it is divisible on the right by both *self* and *other*. If *monic* is `True`, *g* is in addition monic. (With this extra condition, it is uniquely determined.)
- Two Ore polynomials *u* and *v* such that:

$$g = u \cdot a + v \cdot b$$

where *a* is *self* and *b* is *other*.

**Note**

Works only if the base ring is a field (otherwise right gcd do not exist in general).

**EXAMPLES:**

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = (x^2 + t*x + 1) * (x + t)
sage: b = 2 * (x^3 + (t+1)*x^2 + t^2) * (x + t)
sage: g,u,v = a.right_xgcd(b); g
x + t
sage: u*a + v*b == g
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=(t,)); (t,) = k._first_ngens(1)
```

(continues on next page)

(continued from previous page)

```
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = (x**Integer(2) + t*x + Integer(1)) * (x + t)
>>> b = Integer(2) * (x**Integer(3) + (t+Integer(1))*x**Integer(2) +_
<math>t^{**2} * (x + t)
>>> g,u,v = a.right_xgcd(b); g
x + t
>>> u*a + v*b == g
True
```

Specifying `monic=False`, we *can* get a nonmonic gcd:

```
sage: g,u,v = a.right_xgcd(b, monic=False); g
# needs sage.rings.finite_rings
(4*t^2 + 4*t + 1)*x + 4*t^2 + 4*t + 3
sage: u*a + v*b == g
# needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> g,u,v = a.right_xgcd(b, monic=False); g
# needs sage.rings.finite_rings
(4*t^2 + 4*t + 1)*x + 4*t^2 + 4*t + 3
>>> u*a + v*b == g
# needs sage.rings.finite_rings
True
```

The base ring must be a field:

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = (x^2 + t*x + 1) * (x + t)
sage: b = 2 * (x^3 + (t+1)*x^2 + t^2) * (x + t)
sage: a.right_xgcd(b)
Traceback (most recent call last):
...
TypeError: the base ring must be a field
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = (x**Integer(2) + t*x + Integer(1)) * (x + t)
>>> b = Integer(2) * (x**Integer(3) + (t+Integer(1))*x**Integer(2) +_
<math>t^{**2} * (x + t)
>>> a.right_xgcd(b)
Traceback (most recent call last):
...
TypeError: the base ring must be a field
```

`right_xlcm`(*other*, *monic=True*)

Return the right lcm  $L$  of `self` and `other` together with two Ore polynomials  $U$  and  $V$  such that

$$\text{self} \cdot U = \text{other} \cdot V = L.$$

**INPUT:**

- `other` – an Ore polynomial in the same ring as `self`
- `monic` – boolean (default: `True`); whether the right lcm should be normalized to be monic

**EXAMPLES:**

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: P = (x + t) * (x + t^2)
sage: Q = 2 * (x + t) * (x^2 + t + 1)
sage: L, U, V = P.right_xlcm(Q)
sage: L
x^4 + (2*t^2 + t + 2)*x^3 + (3*t^2 + 4*t + 1)*x^2 + (3*t^2 + 4*t + 1)*x + t^2
    ↪+ 4
sage: P * U == L
True
sage: Q * V == L
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='t,); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> P = (x + t) * (x + t**Integer(2))
>>> Q = Integer(2) * (x + t) * (x**Integer(2) + t + Integer(1))
>>> L, U, V = P.right_xlcm(Q)
>>> L
x^4 + (2*t^2 + t + 2)*x^3 + (3*t^2 + 4*t + 1)*x^2 + (3*t^2 + 4*t + 1)*x + t^2
    ↪+ 4
>>> P * U == L
True
>>> Q * V == L
True
```

**shift( $n$ )**

Return `self` multiplied on the right by the power  $x^n$ .

If  $n$  is negative, terms below  $x^n$  will be discarded.

**EXAMPLES:**

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = x^5 + t^4*x^4 + t^2*x^2 + t^10
sage: a.shift(0)
x^5 + t^4*x^4 + t^2*x^2 + t^10
```

(continues on next page)

(continued from previous page)

```
sage: a.shift(-1)
x^4 + t^4*x^3 + t^2*x
sage: a.shift(-5)
1
sage: a.shift(2)
x^7 + t^4*x^6 + t^2*x^4 + t^10*x^2
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = x**Integer(5) + t**Integer(4)*x**Integer(4) +_
... t**Integer(2)*x**Integer(2) + t**Integer(10)
>>> a.shift(Integer(0))
x^5 + t^4*x^4 + t^2*x^2 + t^10
>>> a.shift(-Integer(1))
x^4 + t^4*x^3 + t^2*x
>>> a.shift(-Integer(5))
1
>>> a.shift(Integer(2))
x^7 + t^4*x^6 + t^2*x^4 + t^10*x^2
```

One can also use the infix shift operator:

```
sage: a >> 2
x^3 + t^4*x^2 + t^2
sage: a << 2
x^7 + t^4*x^6 + t^2*x^4 + t^10*x^2
```

```
>>> from sage.all import *
>>> a >> Integer(2)
x^3 + t^4*x^2 + t^2
>>> a << Integer(2)
x^7 + t^4*x^6 + t^2*x^4 + t^10*x^2
```

### **square()**

Return the square of `self`.

#### EXAMPLES:

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x', sigma]
sage: a = x + t; a
x + t
sage: a.square()
x^2 + (2*t + 1)*x + t^2
sage: a.square() == a*a
True

sage: der = R.derivation()
sage: A.<d> = R['d', der]
```

(continues on next page)

(continued from previous page)

```
sage: (d + t).square()
d^2 + 2*t*d + t^2 + 1
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x', sigma]; (x,) = S._first_ngens(1)
>>> a = x + t; a
x + t
>>> a.square()
x^2 + (2*t + 1)*x + t^2
>>> a.square() == a*a
True

>>> der = R.derivation()
>>> A = R['d', der]; (d,) = A._first_ngens(1)
>>> (d + t).square()
d^2 + 2*t*d + t^2 + 1
```

**variable\_name()**

Return the string name of the variable used in `self`.

EXAMPLES:

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = x + t
sage: a.variable_name()
'x'
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = x + t
>>> a.variable_name()
'x'
```

**class** sage.rings.polynomial.ore\_polynomial\_element.**OrePolynomialBaseringInjection**

Bases: `Morphism`

Representation of the canonical homomorphism from a ring  $R$  into an Ore polynomial ring over  $R$ .

This class is necessary for automatic coercion from the base ring to the Ore polynomial ring.

See also

`PolyomialBaseringInjection`

EXAMPLES:

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: S.coerce_map_from(S.base_ring()) #indirect doctest
Ore Polynomial base injection morphism:
From: Univariate Polynomial Ring in t over Rational Field
To:   Ore Polynomial Ring in x over Univariate Polynomial Ring in t
      over Rational Field twisted by t |--> t + 1
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> S.coerce_map_from(S.base_ring()) #indirect doctest
Ore Polynomial base injection morphism:
From: Univariate Polynomial Ring in t over Rational Field
To:   Ore Polynomial Ring in x over Univariate Polynomial Ring in t
      over Rational Field twisted by t |--> t + 1
```

### an\_element()

Return an element of the codomain of the ring homomorphism.

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: from sage.rings.polynomial.ore_polynomial_element import_
    OrePolynomialBaseringInjection
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: m = OrePolynomialBaseringInjection(k, k['x', Frob])
sage: m.an_element()
x
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> from sage.rings.polynomial.ore_polynomial_element import_
    OrePolynomialBaseringInjection
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> m = OrePolynomialBaseringInjection(k, k['x', Frob])
>>> m.an_element()
x
```

### section()

Return the canonical homomorphism from the constants of an Ore polynomial ring to the base ring according to self.

**class** sage.rings.polynomial.ore\_polynomial\_element.**OrePolynomial\_generic\_dense**

Bases: *OrePolynomial*

Generic implementation of dense Ore polynomial supporting any valid base ring, twisting morphism and twisting derivation.

**coefficients** (*sparse=True*)

Return the coefficients of the monomials appearing in `self`.

If `sparse=True` (the default), return only the nonzero coefficients. Otherwise, return the same value as `self.list()`.

EXAMPLES:

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = 1 + x^4 + (t+1)*x^2 + t^2
sage: a.coefficients()
[t^2 + 1, t + 1, 1]
sage: a.coefficients(sparse=False)
[t^2 + 1, 0, t + 1, 0, 1]
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = Integer(1) + x**Integer(4) + (t+Integer(1))*x**Integer(2) +_
>>> t**Integer(2)
>>> a.coefficients()
[t^2 + 1, t + 1, 1]
>>> a.coefficients(sparse=False)
[t^2 + 1, 0, t + 1, 0, 1]
```

**degree()**

Return the degree of `self`.

By convention, the zero Ore polynomial has degree  $-1$ .

EXAMPLES:

```
sage: R.<t> = ZZ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = x^2 + t*x^3 + t^2*x + 1
sage: a.degree()
3
```

```
>>> from sage.all import *
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = x**Integer(2) + t*x**Integer(3) + t**Integer(2)*x + Integer(1)
>>> a.degree()
3
```

By convention, the degree of 0 is  $-1$ :

```
sage: S(0).degree()
-1
```

```
>>> from sage.all import *
>>> S(Integer(0)).degree()
-1
```

**dict()**

Return a dictionary representation of `self`.

**EXAMPLES:**

```
sage: R.<t> = ZZ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = x^2012 + t*x^1006 + t^3 + 2*t
sage: a.monomial_coefficients()
{0: t^3 + 2*t, 1006: t, 2012: 1}
```

```
>>> from sage.all import *
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = x**Integer(2012) + t*x**Integer(1006) + t**Integer(3) + Integer(2)*t
>>> a.monomial_coefficients()
{0: t^3 + 2*t, 1006: t, 2012: 1}
```

`dict` is an alias:

```
sage: a.dict()
{0: t^3 + 2*t, 1006: t, 2012: 1}
```

```
>>> from sage.all import *
>>> a.dict()
{0: t^3 + 2*t, 1006: t, 2012: 1}
```

**hilbert\_shift(s, var=None)**

Return this Ore polynomial with variable shifted by  $s$ , i.e. if this Ore polynomial is  $P(x)$ , return  $P(x + s)$ .

**INPUT:**

- `s` – an element in the base ring
- `var` – string; the variable name

**EXAMPLES:**

```
sage: R.<t> = GF(7) []
sage: der = R.derivation()
sage: A.<d> = R['d', der]

sage: L = d^3 + t*d^2
sage: L.hilbert_shift(t)
d^3 + 4*t*d^2 + (5*t^2 + 3)*d + 2*t^3 + 4*t
sage: (d+t)^3 + t*(d+t)^2
d^3 + 4*t*d^2 + (5*t^2 + 3)*d + 2*t^3 + 4*t
```

```
>>> from sage.all import *
>>> R = GF(Integer(7))['t']; (t,) = R._first_ngens(1)
>>> der = R.derivation()
>>> A = R['d', der]; (d,) = A._first_ngens(1)

>>> L = d**Integer(3) + t*d**Integer(2)
>>> L.hilbert_shift(t)
d^3 + 4*t*d^2 + (5*t^2 + 3)*d + 2*t^3 + 4*t
>>> (d+t)**Integer(3) + t*(d+t)**Integer(2)
d^3 + 4*t*d^2 + (5*t^2 + 3)*d + 2*t^3 + 4*t
```

One can specify another variable name:

```
sage: L.hilbert_shift(t, var='x')
x^3 + 4*t*x^2 + (5*t^2 + 3)*x + 2*t^3 + 4*t
```

```
>>> from sage.all import *
>>> L.hilbert_shift(t, var='x')
x^3 + 4*t*x^2 + (5*t^2 + 3)*x + 2*t^3 + 4*t
```

When the twisting morphism is not trivial, the output lies in a different Ore polynomial ring:

```
sage: # needs sage.rings.finite_rings
sage: k.<a> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: P = x^2 + a*x + a^2
sage: Q = P.hilbert_shift(a); Q
x^2 + (2*a^2 + a + 4)*x + a^2 + 3*a + 4
sage: Q.parent()
Ore Polynomial Ring in x over
Finite Field in a of size 5^3 twisted by a |--> a^5 and a*([a |--> a^5] - id)
sage: Q.parent() is S
False
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=('a',)); (a,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> P = x**Integer(2) + a*x + a**Integer(2)
>>> Q = P.hilbert_shift(a); Q
x^2 + (2*a^2 + a + 4)*x + a^2 + 3*a + 4
>>> Q.parent()
Ore Polynomial Ring in x over
Finite Field in a of size 5^3 twisted by a |--> a^5 and a*([a |--> a^5] - id)
>>> Q.parent() is S
False
```

This behavior ensures that the Hilbert shift by a fixed element defines a homomorphism of rings:

```
sage: # needs sage.rings.finite_rings
sage: U = S.random_element(degree=5)
```

(continues on next page)

(continued from previous page)

```
sage: V = S.random_element(degree=5)
sage: s = k.random_element()
sage: (U+V).hilbert_shift(s) == U.hilbert_shift(s) + V.hilbert_shift(s)
True
sage: (U*V).hilbert_shift(s) == U.hilbert_shift(s) * V.hilbert_shift(s)
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> U = S.random_element(degree=Integer(5))
>>> V = S.random_element(degree=Integer(5))
>>> s = k.random_element()
>>> (U+V).hilbert_shift(s) == U.hilbert_shift(s) + V.hilbert_shift(s)
True
>>> (U*V).hilbert_shift(s) == U.hilbert_shift(s) * V.hilbert_shift(s)
True
```

We check that shifting by an element and then by its opposite gives back the initial Ore polynomial:

```
sage: # needs sage.rings.finite_rings
sage: P = S.random_element(degree=10)
sage: s = k.random_element()
sage: P.hilbert_shift(s).hilbert_shift(-s) == P
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> P = S.random_element(degree=Integer(10))
>>> s = k.random_element()
>>> P.hilbert_shift(s).hilbert_shift(-s) == P
True
```

### **list (copy=True)**

Return a list of the coefficients of self.

EXAMPLES:

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = 1 + x^4 + (t+1)*x^2 + t^2
sage: l = a.list(); l
[t^2 + 1, 0, t + 1, 0, 1]
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = Integer(1) + x**Integer(4) + (t+Integer(1))*x**Integer(2) +_
>>> t**Integer(2)
>>> l = a.list(); l
[t^2 + 1, 0, t + 1, 0, 1]
```

Note that  $l$  is a list, it is mutable, and each call to the list method returns a new list:

```
sage: type(l)
<... 'list'>
sage: l[0] = 5
sage: a.list()
[t^2 + 1, 0, t + 1, 0, 1]
```

```
>>> from sage.all import *
>>> type(l)
<... 'list'>
>>> l[Integer(0)] = Integer(5)
>>> a.list()
[t^2 + 1, 0, t + 1, 0, 1]
```

### `monomial_coefficients()`

Return a dictionary representation of `self`.

EXAMPLES:

```
sage: R.<t> = ZZ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = x^2012 + t*x^1006 + t^3 + 2*t
sage: a.monomial_coefficients()
{0: t^3 + 2*t, 1006: t, 2012: 1}
```

```
>>> from sage.all import *
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = x**Integer(2012) + t*x**Integer(1006) + t**Integer(3) + Integer(2)*t
>>> a.monomial_coefficients()
{0: t^3 + 2*t, 1006: t, 2012: 1}
```

`dict` is an alias:

```
sage: a.dict()
{0: t^3 + 2*t, 1006: t, 2012: 1}
```

```
>>> from sage.all import *
>>> a.dict()
{0: t^3 + 2*t, 1006: t, 2012: 1}
```

### `truncate( $n$ )`

Return the polynomial resulting from discarding all monomials of degree at least  $n$ .

EXAMPLES:

```
sage: R.<t> = ZZ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = t*x^3 + x^4 + (t+1)*x^2
sage: a.truncate(4)
```

(continues on next page)

(continued from previous page)

```
t*x^3 + (t + 1)*x^2
sage: a.truncate(3)
(t + 1)*x^2
```

```
>>> from sage.all import *
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = t*x**Integer(3) + x**Integer(4) + (t+Integer(1))*x**Integer(2)
>>> a.truncate(Integer(4))
t*x^3 + (t + 1)*x^2
>>> a.truncate(Integer(3))
(t + 1)*x^2
```

**valuation()**

Return the minimal degree of a nonzero monomial of `self`.

By convention, the zero Ore polynomial has valuation  $+\infty$ .

EXAMPLES:

```
sage: R.<t> = ZZ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = x^2 + t*x^3 + t^2*x
sage: a.valuation()
1
```

```
>>> from sage.all import *
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = x**Integer(2) + t*x**Integer(3) + t**Integer(2)*x
>>> a.valuation()
1
```

By convention, the valuation of 0 is  $+\infty$ :

```
sage: S(0).valuation()
+Infinity
```

```
>>> from sage.all import *
>>> S(Integer(0)).valuation()
+Infinity
```

## 1.3 Univariate skew polynomial rings

This module provides the `SkewPolynomialRing`. In the class hierarchy in Sage, the locution *Skew Polynomial* is used for a Ore polynomial without twisting derivation.

This module also provides:

- the class `SkewPolynomialRing_finite_order`, which is a specialized class for skew polynomial rings over fields equipped with an automorphism of finite order. It inherits from `SkewPolynomialRing` but contains more methods and provides better algorithms.
- the class `SkewPolynomialRing_finite_field`, which is a specialized class for skew polynomial rings over finite fields.

 See also

`OrePolynomialRing`

AUTHOR:

**class** sage.rings.polynomial.skew\_polynomial\_ring.**SectionSkewPolynomialCenterInjection**

Bases: `Section`

Section of the canonical injection of the center of a skew polynomial ring into this ring.

**class** sage.rings.polynomial.skew\_polynomial\_ring.**SkewPolynomialCenterInjection**(*domain*,  
*codomain*,  
*embed*,  
*order*)

Bases: `RingHomomorphism`

Canonical injection of the center of a skew polynomial ring into this ring.

**section()**

Return a section of this morphism.

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<a> = GF(5^3)
sage: S.<x> = SkewPolynomialRing(k, k.frobenius_endomorphism())
sage: Z = S.center()
sage: iota = S.convert_map_from(Z)
sage: sigma = iota.section()
sage: sigma(x^3)
z
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=('a',)); (a,) = k._first_ngens(1)
>>> S = SkewPolynomialRing(k, k.frobenius_endomorphism(), names=('x',)); (x,) =
>>> z = S._first_ngens(1)
>>> Z = S.center()
>>> iota = S.convert_map_from(Z)
>>> sigma = iota.section()
>>> sigma(x**Integer(3))
z
```

```
class sage.rings.polynomial.skew_polynomial_ring.SkewPolynomialRing(base_ring, morphism,
                                                               derivation, name, sparse,
                                                               category=None)
```

Bases: *OrePolynomialRing*

Initialize `self`.

INPUT:

- `base_ring` – a commutative ring
- `twisting_morphism` – an automorphism of the base ring
- `name` – string or list of strings representing the name of the variables of ring
- `sparse` – boolean (default: `False`)
- `category` – a category

EXAMPLES:

```
sage: R.<t> = ZZ[]
sage: sigma = R.hom([t + 1])
sage: S.<x> = SkewPolynomialRing(R,sigma)
sage: S.category()
Category of algebras over Univariate Polynomial Ring in t over Integer Ring
sage: S([1]) + S([-1])
0
sage: TestSuite(S).run()
```

```
>>> from sage.all import *
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t + Integer(1)])
>>> S = SkewPolynomialRing(R,sigma, names=('x',)); (x,) = S._first_ngens(1)
>>> S.category()
Category of algebras over Univariate Polynomial Ring in t over Integer Ring
>>> S([Integer(1)]) + S([-Integer(1)])
0
>>> TestSuite(S).run()
```

### `lagrange_polynomial`(*points*)

Return the minimal-degree polynomial which interpolates the given points.

More precisely, given  $n$  pairs  $(x_1, y_1), \dots, (x_n, y_n) \in R^2$ , where  $R$  is `self.base_ring()`, compute a skew polynomial  $p(x)$  such that  $p(x_i) = y_i$  for each  $i$ , under the condition that the  $x_i$  are linearly independent over the fixed field of `self.twisting_morphism()`.

If the  $x_i$  are linearly independent over the fixed field of `self.twisting_morphism()` then such a polynomial is guaranteed to exist. Otherwise, it might exist depending on the  $y_i$ , but the algorithm used in this implementation does not support that, and so an error is always raised.

INPUT:

- `points` – list of pairs  $(x_1, y_1), \dots, (x_n, y_n)$  of elements of the base ring of `self`; the  $x_i$  should be linearly independent over the fixed field of `self.twisting_morphism()`

OUTPUT: the Lagrange polynomial

EXAMPLES:

```

sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: points = [(t, 3*t^2 + 4*t + 4), (t^2, 4*t)]
sage: d = S.lagrange_polynomial(points); d
x + t

sage: R.<t> = ZZ[]
sage: sigma = R.hom([t + 1])
sage: T.<x> = R['x', sigma]
sage: points = [(1, t^2 + 3*t + 4), (t, 2*t^2 + 3*t + 1), (t^2, t^2 + 3*t + 4)]
sage: p = T.lagrange_polynomial(points); p
((-t^4 - 2*t - 3)/-2)*x^2 + (-t^4 - t^3 - t^2 - 3*t - 2)*x
+ (-t^4 - 2*t^3 - 4*t^2 - 10*t - 9)/-2
sage: p.multi_point_evaluation([1, t, t^2]) == [t^2 + 3*t + 4, 2*t^2 + 3*t + 1, t^2 + 3*t + 4]
True

```

```

>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='t,); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> points = [(t, Integer(3)*t**Integer(2) + Integer(4)*t + Integer(4)), (t^2, Integer(2)*t**Integer(2) + Integer(3)*t + Integer(1)), (t**Integer(2), t**Integer(2) + Integer(3)*t + Integer(4))]
>>> d = S.lagrange_polynomial(points); d
x + t

>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t + Integer(1)])
>>> T = R['x', sigma]; (x,) = T._first_ngens(1)
>>> points = [(Integer(1), t**Integer(2) + Integer(3)*t + Integer(4)), (t, t**Integer(2)*t**Integer(2) + Integer(3)*t + Integer(1)), (t**Integer(2), t**Integer(2) + Integer(3)*t + Integer(4))]
>>> p = T.lagrange_polynomial(points); p
((-t^4 - 2*t - 3)/-2)*x^2 + (-t^4 - t^3 - t^2 - 3*t - 2)*x
+ (-t^4 - 2*t^3 - 4*t^2 - 10*t - 9)/-2
>>> p.multi_point_evaluation([Integer(1), t, t**Integer(2)]) ==
>>> [t**Integer(2) + Integer(3)*t + Integer(4), Integer(2)*t**Integer(2) + Integer(3)*t + Integer(1), t**Integer(2) + Integer(3)*t + Integer(4)]
True

```

If the  $x_i$  are linearly dependent over the fixed field of `self.twisting_morphism()`, then an error is raised:

```

sage: T.lagrange_polynomial([(t, 1), (2*t, 3)])
Traceback (most recent call last):
...
ValueError: the given evaluation points are linearly dependent over the fixed
field of the twisting morphism,
so a Lagrange polynomial could not be determined (and might not exist)

```

```
>>> from sage.all import *
>>> T.lagrange_polynomial([(t, Integer(1)), (Integer(2)*t, Integer(3))])
Traceback (most recent call last):
...
ValueError: the given evaluation points are linearly dependent over the fixed_
field of the twisting morphism,
so a Lagrange polynomial could not be determined (and might not exist)
```

**minimal\_vanishing\_polynomial(eval\_pts)**

Return the minimal-degree, monic skew polynomial which vanishes at all the given evaluation points.

The degree of the vanishing polynomial is at most the length of `eval_pts`. Equality holds if and only if the elements of `eval_pts` are linearly independent over the fixed field of `self.twisting_morphism()`.

- `eval_pts` – list of evaluation points which are linearly independent over the fixed field of the twisting morphism of the associated skew polynomial ring

**OUTPUT:** the minimal vanishing polynomial

**EXAMPLES:**

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: eval_pts = [1, t, t^2]
sage: b = S.minimal_vanishing_polynomial(eval_pts); b
x^3 + 4
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='t,); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> eval_pts = [Integer(1), t, t**Integer(2)]
>>> b = S.minimal_vanishing_polynomial(eval_pts); b
x^3 + 4
```

The minimal vanishing polynomial evaluates to 0 at each of the evaluation points:

```
sage: eval = b.multi_point_evaluation(eval_pts); eval
# needs sage.rings.finite_rings
[0, 0, 0]
```

```
>>> from sage.all import *
>>> eval = b.multi_point_evaluation(eval_pts); eval
# needs sage.rings.finite_rings
[0, 0, 0]
```

If the evaluation points are linearly dependent over the fixed field of the twisting morphism, then the returned polynomial has lower degree than the number of evaluation points:

```
sage: S.minimal_vanishing_polynomial([t])
# needs sage.rings.finite_rings
```

(continues on next page)

(continued from previous page)

```
x + 3*t^2 + 3*t
sage: S.minimal_vanishing_polynomial([t, 3*t])
# needs sage.rings.finite_rings
x + 3*t^2 + 3*t
```

```
>>> from sage.all import *
>>> S.minimal_vanishing_polynomial([t])
# needs sage.rings.finite_rings
x + 3*t^2 + 3*t
>>> S.minimal_vanishing_polynomial([t, Integer(3)*t])
# needs sage.rings.finite_rings
x + 3*t^2 + 3*t
```

**class** sage.rings.polynomial.skew\_polynomial\_ring.**SkewPolynomialRing\_finite\_field**(*base\_ring*,  
*morphism*,  
*derivation*,  
*names*,  
*sparse*,  
*category*=None)

Bases: *SkewPolynomialRing\_finite\_order*

A specialized class for skew polynomial rings over finite fields.

### See also

- sage.rings.polynomial.skew\_polynomial\_ring.*SkewPolynomialRing*
- sage.rings.polynomial.skew\_polynomial\_finite\_field

### Todo

Add methods related to center of skew polynomial ring, irreducibility, karatsuba multiplication and factorization.

**class** sage.rings.polynomial.skew\_polynomial\_ring.**SkewPolynomialRing\_finite\_order**(*base\_ring*,  
*morphism*,  
*derivation*,  
*name*,  
*sparse*,  
*category*=None)

Bases: *SkewPolynomialRing*

A specialized class for skew polynomial rings whose twisting morphism has finite order.

### See also

- `sage.rings.polynomial.skew_polynomial_ring.SkewPolynomialRing`
- `sage.rings.polynomial.skew_polynomial_finite_order`

`center(name=None, names=None, default=False)`

Return the center of this skew polynomial ring.

### Note

If  $F$  denotes the subring of  $R$  fixed by  $\sigma$  and  $\sigma$  has order  $r$ , the center of  $K[x, \sigma]$  is  $F[x^r]$ , that is a univariate polynomial ring over  $F$ .

INPUT:

- `name` – string or `None` (default: `None`); the name for the central variable (namely  $x^r$ )
- `default` – boolean (default: `False`); if `True`, set the default variable name for the center to `name`

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]; S
Ore Polynomial Ring in x over Finite Field in t of size 5^3
twisted by t |--> t^5
sage: Z = S.center(); Z
Univariate Polynomial Ring in z over Finite Field of size 5
sage: Z.gen()
z
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1); S
Ore Polynomial Ring in x over Finite Field in t of size 5^3
twisted by t |--> t^5
>>> Z = S.center(); Z
Univariate Polynomial Ring in z over Finite Field of size 5
>>> Z.gen()
z
```

We can pass in another variable name:

```
sage: S.center(name='y') #_
needs sage.rings.finite_rings
Univariate Polynomial Ring in y over Finite Field of size 5
```

```
>>> from sage.all import *
>>> S.center(name='y')
→needs sage.rings.finite_rings
Univariate Polynomial Ring in y over Finite Field of size 5
```

or use the bracket notation:

```
sage: Zy.<y> = S.center(); Zy
→needs sage.rings.finite_rings
Univariate Polynomial Ring in y over Finite Field of size 5
sage: y.parent() is Zy
→needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> Zy = S.center(names=('y',)); (y,) = Zy._first_ngens(1); Zy
→
# needs sage.rings.finite_rings
Univariate Polynomial Ring in y over Finite Field of size 5
>>> y.parent() is Zy
→needs sage.rings.finite_rings
True
```

A coercion map from the center to the skew polynomial ring is set:

```
sage: # needs sage.rings.finite_rings
sage: S.has_coerce_map_from(Zy)
True
sage: P = y + x; P
x^3 + x
sage: P.parent()
Ore Polynomial Ring in x over Finite Field in t of size 5^3
twisted by t |--> t^5
sage: P.parent() is S
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> S.has_coerce_map_from(Zy)
True
>>> P = y + x; P
x^3 + x
>>> P.parent()
Ore Polynomial Ring in x over Finite Field in t of size 5^3
twisted by t |--> t^5
>>> P.parent() is S
True
```

together with a conversion map in the reverse direction:

```
sage: Zy(x^6 + 2*x^3 + 3)
→needs sage.rings.finite_rings
y^2 + 2*y + 3
```

(continues on next page)

(continued from previous page)

```
sage: Zy(x^2)
      ↪needs sage.rings.finite_rings
Traceback (most recent call last):
...
ValueError: x^2 is not in the center
```

```
>>> from sage.all import *
>>> Zy(x**Integer(6) + Integer(2)*x**Integer(3) + Integer(3))
      ↪                                         # needs sage.rings.finite_rings
y^2 + 2*y + 3

>>> Zy(x**Integer(2))
      ↪                                         # needs sage.rings.finite_rings
Traceback (most recent call last):
...
ValueError: x^2 is not in the center
```

Two different skew polynomial rings can share the same center:

```
sage: S1.<x1> = k['x1', Frob]
      ↪needs sage.rings.finite_rings
sage: S2.<x2> = k['x2', Frob]
      ↪needs sage.rings.finite_rings
sage: S1.center() is S2.center()
      ↪needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> S1 = k['x1', Frob]; (x1,) = S1._first_ngens(1) # needs sage.rings.finite_
      ↪rings
>>> S2 = k['x2', Frob]; (x2,) = S2._first_ngens(1) # needs sage.rings.finite_
      ↪rings
>>> S1.center() is S2.center()
      ↪needs sage.rings.finite_rings
True
```

### About the default name of the central variable

A priori, the default is  $z$ .

However, a variable name is given the first time this method is called, the given name become the default for the next calls:

```
sage: # needs sage.rings.finite_rings
sage: K.<t> = GF(11^3)
sage: phi = K.frobenius_endomorphism()
sage: A.<X> = K['X', phi]
sage: C.<u> = A.center() # first call
sage: C
Univariate Polynomial Ring in u over Finite Field of size 11
sage: A.center() # second call: the variable name is still u
Univariate Polynomial Ring in u over Finite Field of size 11
```

(continues on next page)

(continued from previous page)

```
sage: A.center() is C
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> K = GF(Integer(11)**Integer(3), names=(t,),); (t,) = K._first_ngens(1)
>>> phi = K.frobenius_endomorphism()
>>> A = K[X, phi]; (X,) = A._first_ngens(1)
>>> C = A.center(names=(u,)); (u,) = C._first_ngens(1) # first call
>>> C
Univariate Polynomial Ring in u over Finite Field of size 11
>>> A.center() # second call: the variable name is still u
Univariate Polynomial Ring in u over Finite Field of size 11
>>> A.center() is C
True
```

We can update the default variable name by passing in the argument `default=True`:

```
sage: # needs sage.rings.finite_rings
sage: D.<v> = A.center(default=True)
sage: D
Univariate Polynomial Ring in v over Finite Field of size 11
sage: A.center()
Univariate Polynomial Ring in v over Finite Field of size 11
sage: A.center() is D
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> D = A.center(default=True, names=(v,)); (v,) = D._first_ngens(1)
>>> D
Univariate Polynomial Ring in v over Finite Field of size 11
>>> A.center()
Univariate Polynomial Ring in v over Finite Field of size 11
>>> A.center() is D
True
```

## 1.4 Univariate skew polynomials

This module provides the `SkewPolynomial`. In the class hierarchy in Sage, the locution *Skew Polynomial* is used for a Ore polynomial without twisting derivation.

### Warning

The current semantics of `__call__()` are experimental, so a warning is thrown when a skew polynomial is evaluated for the first time in a session. See the method documentation for details.

#### AUTHORS:

- Xavier Caruso (2012-06-29): initial version

- Arpit Merchant (2016-08-04): improved docstrings, fixed doctests and refactored classes and methods
- Johan Rosenkilde (2016-08-03): changes for bug fixes, docstring and doctest errors

```
class sage.rings.polynomial.skew_polynomial_element.SkewPolynomial_generic_dense
Bases: OrePolynomial_generic_dense
```

Generic implementation of dense skew polynomial supporting any valid base ring and twisting morphism.

**conjugate(n)**

Return `self` conjugated by  $x^n$ , where  $x$  is the variable of `self`.

The conjugate is obtained from `self` by applying the  $n$ -th iterate of the twisting morphism to each of its coefficients.

**INPUT:**

- $n$  – integer; the power of conjugation

**EXAMPLES:**

```
sage: R.<t> = QQ[]
sage: K = R.fraction_field()
sage: sigma = K.hom([1 + 1/t])
sage: S.<x> = K['x',sigma]
sage: a = t*x^3 + (t^2 + 1)*x^2 + 2*t
sage: b = a.conjugate(2); b
((2*t + 1)/(t + 1))*x^3 + ((5*t^2 + 6*t + 2)/(t^2 + 2*t + 1))*x^2 + (4*t + 2)/
(t + 1)
sage: x^2*a == b*x^2
True
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> K = R.fraction_field()
>>> sigma = K.hom([Integer(1) + Integer(1)/t])
>>> S = K['x',sigma]; (x,) = S._first_ngens(1)
>>> a = t*x**Integer(3) + (t**Integer(2) + Integer(1))*x**Integer(2) +
Integer(2)*t
>>> b = a.conjugate(Integer(2)); b
((2*t + 1)/(t + 1))*x^3 + ((5*t^2 + 6*t + 2)/(t^2 + 2*t + 1))*x^2 + (4*t + 2)/
(t + 1)
>>> x**Integer(2)*a == b*x**Integer(2)
True
```

In principle, negative values for  $n$  are allowed, but Sage needs to be able to invert the twisting morphism:

```
sage: b = a.conjugate(-1)
Traceback (most recent call last):
...
NotImplementedError: inverse not implemented for morphisms of
Fraction Field of Univariate Polynomial Ring in t over Rational Field
```

```
>>> from sage.all import *
>>> b = a.conjugate(-Integer(1))
Traceback (most recent call last):
...
```

(continues on next page)

(continued from previous page)

```
NotImplementedError: inverse not implemented for morphisms of
Fraction Field of Univariate Polynomial Ring in t over Rational Field
```

Here is a working example:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: T.<y> = k['y',Frob]
sage: u = T.random_element()
sage: v = u.conjugate(-1)
sage: u*y == y*v
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='t,); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> T = k['y',Frob]; (y,) = T._first_ngens(1)
>>> u = T.random_element()
>>> v = u.conjugate(-Integer(1))
>>> u*y == y*v
True
```

### `left_power_mod(exp, modulus)`

Return the remainder of `self**exp` in the left euclidean division by `modulus`.

INPUT:

- `exp` – an Integer
- `modulus` – a skew polynomial in the same ring as `self`

OUTPUT:

Remainder of `self**exp` in the left euclidean division by `modulus`.

REMARK:

The quotient of the underlying skew polynomial ring by the principal ideal generated by `modulus` is in general *not* a ring.

As a consequence, Sage first computes exactly `self**exp` and then reduce it modulo `modulus`.

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = x + t
sage: modulus = x^3 + t*x^2 + (t+3)*x - 2
sage: a.left_power_mod(100,modulus)
(4*t^2 + t + 1)*x^2 + (t^2 + 4*t + 1)*x + 3*t^2 + 3*t
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=(t,),); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = x + t
>>> modulus = x**Integer(3) + t*x**Integer(2) + (t+Integer(3))*x - Integer(2)
>>> a.left_power_mod(Integer(100),modulus)
(4*t^2 + t + 1)*x^2 + (t^2 + 4*t + 1)*x + 3*t^2 + 3*t
```

**multi\_point\_evaluation(eval\_pts)**

Evaluate `self` at list of evaluation points.

**INPUT:**

- `eval_pts` – list of points at which `self` is to be evaluated

**OUTPUT:** list of values of `self` at the `eval_pts`

 **Todo**

This method currently trivially calls the evaluation function repeatedly. If fast skew polynomial multiplication is available, an asymptotically faster method is possible using standard divide and conquer techniques and `minimal_vanishing_polynomial()`.

**EXAMPLES:**

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = x + t
sage: eval_pts = [1, t, t^2]
sage: c = a.multi_point_evaluation(eval_pts); c
[t + 1, 3*t^2 + 4*t + 4, 4*t]
sage: c == [ a(e) for e in eval_pts ]
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=(t,),); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = x + t
>>> eval_pts = [Integer(1), t, t**Integer(2)]
>>> c = a.multi_point_evaluation(eval_pts); c
[t + 1, 3*t^2 + 4*t + 4, 4*t]
>>> c == [ a(e) for e in eval_pts ]
True
```

**operator\_eval(eval\_pt)**

Evaluate `self` at `eval_pt` by the operator evaluation method.

**INPUT:**

- `eval_pt` – element of the base ring of `self`

OUTPUT: the value of the polynomial at the point specified by the argument

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: T.<x> = k['x',Frob]
sage: a = 3*t^2*x^2 + (t + 1)*x + 2
sage: a(t) #indirect test
2*t^2 + 2*t + 3
sage: a.operator_eval(t)
2*t^2 + 2*t + 3
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='t,); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> T = k['x',Frob]; (x,) = T._first_ngens(1)
>>> a = Integer(3)*t**Integer(2)*x**Integer(2) + (t + Integer(1))*x +_
>>> Integer(2)
>>> a(t) #indirect test
2*t^2 + 2*t + 3
>>> a.operator_eval(t)
2*t^2 + 2*t + 3
```

Evaluation points outside the base ring is usually not possible due to the twisting morphism:

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x',sigma]
sage: a = t*x + 1
sage: a.operator_eval(1/t)
Traceback (most recent call last):
...
TypeError: 1/t fails to convert into the map's domain
Univariate Polynomial Ring in t over Rational Field,
but a `pushforward` method is not properly implemented
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> a = t*x + Integer(1)
>>> a.operator_eval(Integer(1)/t)
Traceback (most recent call last):
...
TypeError: 1/t fails to convert into the map's domain
Univariate Polynomial Ring in t over Rational Field,
but a `pushforward` method is not properly implemented
```

#### `right_power_mod(exp, modulus)`

Return the remainder of `self**exp` in the right euclidean division by `modulus`.

## INPUT:

- `exp` – integer
- `modulus` – a skew polynomial in the same ring as `self`

## OUTPUT:

Remainder of `self**exp` in the right euclidean division by `modulus`.

## REMARK:

The quotient of the underlying skew polynomial ring by the principal ideal generated by `modulus` is in general *not* a ring.

As a consequence, Sage first computes exactly `self**exp` and then reduce it modulo `modulus`.

## EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = x + t
sage: b = a^5 # indirect doctest
sage: b
x^5 + (2*t^2 + 4)*x^4 + (t^2 + 2)*x^3 + 2*x^2 + (4*t^2 + 2)*x + 2*t^2 + 4*t + 4
sage: b == a * a * a * a * a
True
sage: modulus = x^3 + t*x^2 + (t+3)*x - 2
sage: br = a.right_power_mod(5, modulus); br
(t + 1)*x^2 + (2*t^2 + t + 1)*x + 2*t^2 + 4*t + 2
sage: br == b % modulus
True
sage: a.right_power_mod(100, modulus)
(2*t^2 + 3)*x^2 + (t^2 + 4*t + 2)*x + t^2 + 2*t + 1
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='t,); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = x + t
>>> b = a**Integer(5) # indirect doctest
>>> b
x^5 + (2*t^2 + 4)*x^4 + (t^2 + 2)*x^3 + 2*x^2 + (4*t^2 + 2)*x + 2*t^2 + 4*t + 4
>>> b == a * a * a * a * a
True
>>> modulus = x**Integer(3) + t*x**Integer(2) + (t+Integer(3))*x - Integer(2)
>>> br = a.right_power_mod(Integer(5), modulus); br
(t + 1)*x^2 + (2*t^2 + t + 1)*x + 2*t^2 + 4*t + 2
>>> br == b % modulus
True
>>> a.right_power_mod(Integer(100), modulus)
(2*t^2 + 3)*x^2 + (t^2 + 4*t + 2)*x + t^2 + 2*t + 1
```

Negative exponents are supported:

```
sage: # needs sage.rings.finite_rings sage: a^(-5) (x^5 + (2*t^2 + 4)*x^4 + (t^2 + 2)*x^3 + 2*x^2 + (4*t^2 + 2)*x + 2*t^2 + 4*t + 4)^(-1) sage: b * a^(-5) 1
```

However, they cannot be combined with modulus:

```
sage: a.right_power_mod(-10, modulus)
→needs sage.rings.finite_rings
Traceback (most recent call last):
...
ValueError: modulus cannot be combined with negative exponent
```

```
>>> from sage.all import *
>>> a.right_power_mod(-Integer(10), modulus)
→      # needs sage.rings.finite_rings
Traceback (most recent call last):
...
ValueError: modulus cannot be combined with negative exponent
```

## 1.5 Univariate dense skew polynomials over a field with a finite order automorphism

AUTHOR:

– Xavier Caruso (2012-06-29): initial version

- Arpit Merchant (2016-08-04): improved docstrings, fixed doctests and refactored classes and methods

**class**

```
sage.rings.polynomial.skew_polynomial_finite_order.SkewPolynomial_finite_order_dense
```

Bases: *SkewPolynomial\_generic\_dense*

This method constructs a generic dense skew polynomial over a field equipped with an automorphism of finite order.

INPUT:

- `parent` – parent of `self`
- `x` – list of coefficients from which `self` can be constructed
- `check` – flag variable to normalize the polynomial
- `construct` – boolean (default: `False`)

**bound()**

Return a bound of this skew polynomial (i.e. a multiple of this skew polynomial lying in the center).

### Note

Since `b` is central, it divides a skew polynomial on the left iff it divides it on the right

ALGORITHM:

1. Sage first checks whether `self` is itself in the center. If it is, it returns `self`

2. If an optimal bound was previously computed and cached, Sage returns it
3. Otherwise, Sage returns the reduced norm of `self`

As a consequence, the output of this function may depend on previous computations (an example is given below).

#### EXAMPLES:

```
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: Z = S.center(); Z
Univariate Polynomial Ring in z over Finite Field of size 5

sage: a = x^2 + (4*t + 2)*x + 4*t^2 + 3
sage: b = a.bound(); b
z^2 + z + 4
```

```
>>> from sage.all import *
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> Z = S.center(); Z
Univariate Polynomial Ring in z over Finite Field of size 5

>>> a = x**Integer(2) + (Integer(4)*t + Integer(2))*x +_
... Integer(4)*t**Integer(2) + Integer(3)
>>> b = a.bound(); b
z^2 + z + 4
```

We observe that the bound is explicitly given as an element of the center (which is a univariate polynomial ring in the variable  $z$ ). We can use conversion to send it in the skew polynomial ring:

```
sage: S(b)
x^6 + x^3 + 4
```

```
>>> from sage.all import *
>>> S(b)
x^6 + x^3 + 4
```

We check that  $b$  is divisible by  $a$ :

```
sage: S(b).is_right_divisible_by(a)
True
sage: S(b).is_left_divisible_by(a)
True
```

```
>>> from sage.all import *
>>> S(b).is_right_divisible_by(a)
True
>>> S(b).is_left_divisible_by(a)
True
```

Actually,  $b$  is the reduced norm of  $a$ :

```
sage: b == a.reduced_norm()
True
```

```
>>> from sage.all import *
>>> b == a.reduced_norm()
True
```

Now, we compute the optimal bound of  $a$  and see that it affects the behaviour of `bound()`:

```
sage: a.optimal_bound()
z + 3
sage: a.bound()
z + 3
```

```
>>> from sage.all import *
>>> a.optimal_bound()
z + 3
>>> a.bound()
z + 3
```

### `is_centeral()`

Return `True` if this skew polynomial lies in the center.

EXAMPLES:

```
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]

sage: x.is_centeral()
False
sage: (t*x^3).is_centeral()
False
sage: (x^6 + x^3).is_centeral()
True
```

```
>>> from sage.all import *
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)

>>> x.is_centeral()
False
>>> (t*x**Integer(3)).is_centeral()
False
>>> (x**Integer(6) + x**Integer(3)).is_centeral()
True
```

### `optimal_bound()`

Return the optimal bound of this skew polynomial (i.e. the monic multiple of this skew polynomial of minimal degree lying in the center).

**Note**

The result is cached.

EXAMPLES:

```
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: Z = S.center(); Z
Univariate Polynomial Ring in z over Finite Field of size 5

sage: a = x^2 + (4*t + 2)*x + 4*t^2 + 3
sage: b = a.optimal_bound(); b
z + 3
```

```
>>> from sage.all import *
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> Z = S.center(); Z
Univariate Polynomial Ring in z over Finite Field of size 5

>>> a = x**Integer(2) + (Integer(4)*t + Integer(2))*x +_
... Integer(4)*t**Integer(2) + Integer(3)
>>> b = a.optimal_bound(); b
z + 3
```

We observe that the bound is explicitly given as an element of the center (which is a univariate polynomial ring in the variable  $z$ ). We can use conversion to send it in the skew polynomial ring:

```
sage: S(b)
x^3 + 3
```

```
>>> from sage.all import *
>>> S(b)
x^3 + 3
```

We check that  $b$  is divisible by  $a$ :

```
sage: S(b).is_right_divisible_by(a)
True
sage: S(b).is_left_divisible_by(a)
True
```

```
>>> from sage.all import *
>>> S(b).is_right_divisible_by(a)
True
>>> S(b).is_left_divisible_by(a)
True
```

`reduced_charpoly(var=None)`

Return the reduced characteristic polynomial of this skew polynomial.

## INPUT:

- var – string, a pair of strings or None (default: None); the variable names used for the characteristic polynomial and the center

**Note**

The result is cached.

## EXAMPLES:

```
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<u> = k['u', Frob]
sage: a = u^3 + (2*t^2 + 3)*u^2 + (4*t^2 + t + 4)*u + 2*t^2 + 2
sage: chi = a.reduced_charpoly()
sage: chi
x^3 + (2*z + 1)*x^2 + (3*z^2 + 4*z)*x + 4*z^3 + z^2 + 1
```

```
>>> from sage.all import *
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['u', Frob]; (u,) = S._first_ngens(1)
>>> a = u**Integer(3) + (Integer(2)*t**Integer(2) + Integer(3))*u**Integer(2) +
... + (Integer(4)*t**Integer(2) + t + Integer(4))*u + Integer(2)*t**Integer(2) +
... + Integer(2)
>>> chi = a.reduced_charpoly()
>>> chi
x^3 + (2*z + 1)*x^2 + (3*z^2 + 4*z)*x + 4*z^3 + z^2 + 1
```

The reduced characteristic polynomial has coefficients in the center of  $S$ , which is itself a univariate polynomial ring in the variable  $z = u^3$  over  $\mathbf{F}_5$ . Hence it appears as a bivariate polynomial:

```
sage: chi.parent()
Univariate Polynomial Ring in x over Univariate Polynomial Ring in z over
Finite Field of size 5
```

```
>>> from sage.all import *
>>> chi.parent()
Univariate Polynomial Ring in x over Univariate Polynomial Ring in z over
Finite Field of size 5
```

The constant coefficient of the reduced characteristic polynomial is the reduced norm, up to a sign:

```
sage: chi[0] == -a.reduced_norm()
True
```

```
>>> from sage.all import *
>>> chi[Integer(0)] == -a.reduced_norm()
True
```

Its coefficient of degree  $\deg(a) - 1$  is the opposite of the reduced trace:

```
sage: chi[2] == -a.reduced_trace()
True
```

```
>>> from sage.all import *
>>> chi[Integer(2)] == -a.reduced_trace()
True
```

By default, the name of the variable of the reduced characteristic polynomial is `x` and the name of central variable is usually `z` (see `center()` for more details about this). The user can specify different names if desired:

```
sage: a.reduced_charpoly(var='T') # variable name for the characteristic_
polynomial
T^3 + (2*z + 1)*T^2 + (3*z^2 + 4*z)*T + 4*z^3 + z^2 + 1

sage: a.reduced_charpoly(var=('T', 'c'))
T^3 + (2*c + 1)*T^2 + (3*c^2 + 4*c)*T + 4*c^3 + c^2 + 1
```

```
>>> from sage.all import *
>>> a.reduced_charpoly(var='T') # variable name for the characteristic_
polynomial
T^3 + (2*z + 1)*T^2 + (3*z^2 + 4*z)*T + 4*z^3 + z^2 + 1

>>> a.reduced_charpoly(var=('T', 'c'))
T^3 + (2*c + 1)*T^2 + (3*c^2 + 4*c)*T + 4*c^3 + c^2 + 1
```

### See also

`reduced_trace()`, `reduced_norm()`

`reduced_norm(var=None)`

Return the reduced norm of this skew polynomial.

INPUT:

- `var` – string or `False` or `None` (default: `None`); the variable name. If `False`, return the list of coefficients.

### Note

The result is cached.

EXAMPLES:

```
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: a = x^3 + (2*t^2 + 3)*x^2 + (4*t^2 + t + 4)*x + 2*t^2 + 2
sage: N = a.reduced_norm(); N
z^3 + 4*z^2 + 4
```

```
>>> from sage.all import *
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> a = x**Integer(3) + (Integer(2)*t**Integer(2) + Integer(3))*x**Integer(2) -
>>> (Integer(4)*t**Integer(2) + t + Integer(4))*x + Integer(2)*t**Integer(2) -
>>> Integer(2)
>>> N = a.reduced_norm(); N
z^3 + 4*z^2 + 4
```

The reduced norm lies in the center of  $S$ , which is a univariate polynomial ring in the variable  $z = x^3$  over  $\mathbf{F}_5$ :

```
sage: N.parent()
Univariate Polynomial Ring in z over Finite Field of size 5
sage: N.parent() is S.center()
True
```

```
>>> from sage.all import *
>>> N.parent()
Univariate Polynomial Ring in z over Finite Field of size 5
>>> N.parent() is S.center()
True
```

We can use explicit conversion to view  $N$  as a skew polynomial:

```
sage: S(N)
x^9 + 4*x^6 + 4
```

```
>>> from sage.all import *
>>> S(N)
x^9 + 4*x^6 + 4
```

By default, the name of the central variable is usually  $z$  (see `center()` for more details about this). However, the user can specify a different variable name if desired:

```
sage: a.reduced_norm(var='u')
u^3 + 4*u^2 + 4
```

```
>>> from sage.all import *
>>> a.reduced_norm(var='u')
u^3 + 4*u^2 + 4
```

When passing in `var=False`, a tuple of coefficients (instead of an actual polynomial) is returned:

```
sage: a.reduced_norm(var=False)
(4, 0, 4, 1)
```

```
>>> from sage.all import *
>>> a.reduced_norm(var=False)
(4, 0, 4, 1)
```

ALGORITHM:

If  $r$  (= the order of the twist map) is small compared to  $d$  (= the degree of this skew polynomial), the reduced norm is computed as the determinant of the multiplication by  $P$  (= this skew polynomial) acting on  $K[X, \sigma]$  (= the underlying skew ring) viewed as a free module of rank  $r$  over  $K[X^r]$ .

Otherwise, the reduced norm is computed as the characteristic polynomial of the left multiplication by  $X$  on the quotient  $K[X, \sigma]/K[X, \sigma]P$  (which is a  $K$ -vector space of dimension  $d$ ).

### See also

`reduced_trace()`, `reduced_charpoly()`

**reduced\_trace** (*var=None*)

Return the reduced trace of this skew polynomial.

INPUT:

- *var* – string or `False` or `None` (default: `None`); the variable name. If `False`, return the list of coefficients.

EXAMPLES:

```
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: a = x^3 + (2*t^2 + 3)*x^2 + (4*t^2 + t + 4)*x + 2*t^2 + 2
sage: tr = a.reduced_trace(); tr
3*z + 4
```

```
>>> from sage.all import *
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> a = x**Integer(3) + (Integer(2)*t**Integer(2) + Integer(3))*x**Integer(2) -
...+ (Integer(4)*t**Integer(2) + t + Integer(4))*x + Integer(2)*t**Integer(2) -
...+ Integer(2)
>>> tr = a.reduced_trace(); tr
3*z + 4
```

The reduced trace lies in the center of  $S$ , which is a univariate polynomial ring in the variable  $z = x^3$  over  $\mathbf{F}_5$ :

```
sage: tr.parent()
Univariate Polynomial Ring in z over Finite Field of size 5
sage: tr.parent() is S.center()
True
```

```
>>> from sage.all import *
>>> tr.parent()
Univariate Polynomial Ring in z over Finite Field of size 5
>>> tr.parent() is S.center()
True
```

We can use explicit conversion to view `tr` as a skew polynomial:

```
sage: S(tr)
3*x^3 + 4
```

```
>>> from sage.all import *
>>> S(tr)
3*x^3 + 4
```

By default, the name of the central variable is usually `z` (see [center\(\)](#) for more details about this). However, the user can specify a different variable name if desired:

```
sage: a.reduced_trace(var='u')
3*u + 4
```

```
>>> from sage.all import *
>>> a.reduced_trace(var='u')
3*u + 4
```

When passing in `var=False`, a tuple of coefficients (instead of an actual polynomial) is returned:

```
sage: a.reduced_trace(var=False)
(4, 3)
```

```
>>> from sage.all import *
>>> a.reduced_trace(var=False)
(4, 3)
```

## 1.6 Univariate dense skew polynomials over finite fields

This module provides the class: `sage.rings.polynomial.skew_polynomial_finite_field.SkewPolynomialFiniteFieldDense`, which constructs a single univariate skew polynomial over a finite field equipped with the Frobenius endomorphism. Among other things, it implements the fast factorization algorithm designed in [CL2017].

AUTHOR:

– Xavier Caruso (2012-06-29): initial version

- Arpit Merchant (2016-08-04): improved docstrings, fixed doctests and refactored classes and methods

```
class
sage.rings.polynomial.skew_polynomial_finite_field.SkewPolynomialFiniteFieldDense
Bases: SkewPolynomialFiniteOrderDense
```

**count\_factorizations()**

Return the number of factorizations (as a product of a unit and a product of irreducible monic factors) of this skew polynomial.

EXAMPLES:

```
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = x^4 + (4*t + 3)*x^3 + t^2*x^2 + (4*t^2 + 3*t)*x + 3*t
sage: a.count_factorizations()
216
```

```
>>> from sage.all import *
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = x**Integer(4) + (Integer(4)*t + Integer(3))*x**Integer(3) +_
... t**Integer(2)*x**Integer(2) + (Integer(4)*t**Integer(2) + Integer(3)*t)*x +_
... Integer(3)*t
>>> a.count_factorizations()
216
```

We illustrate that an irreducible polynomial in the center have in general a lot of distinct factorizations in the skew polynomial ring:

```
sage: Z.<x3> = S.center()
sage: N = x3^5 + 4*x3^4 + 4*x3^2 + 4*x3 + 3
sage: N.is_irreducible()
True
sage: S(N).count_factorizations()
30537115626
```

```
>>> from sage.all import *
>>> Z = S.center(names=('x3',)); (x3,) = Z._first_ngens(1)
>>> N = x3**Integer(5) + Integer(4)*x3**Integer(4) +_
... Integer(4)*x3**Integer(2) + Integer(4)*x3 + Integer(3)
>>> N.is_irreducible()
True
>>> S(N).count_factorizations()
30537115626
```

#### count\_irreducible\_divisors()

Return the number of irreducible monic divisors of this skew polynomial.

#### Note

One can prove that there are always as many left irreducible monic divisors as right irreducible monic divisors.

#### EXAMPLES:

```
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
```

```
>>> from sage.all import *
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
```

We illustrate that a skew polynomial may have a number of irreducible divisors greater than its degree:

```
sage: a = x^4 + (4*t + 3)*x^3 + t^2*x^2 + (4*t^2 + 3*t)*x + 3*t
sage: a.count_irreducible_divisors()
12
```

```
>>> from sage.all import *
>>> a = x**Integer(4) + (Integer(4)*t + Integer(3))*x**Integer(3) +_
... t**Integer(2)*x**Integer(2) + (Integer(4)*t**Integer(2) + Integer(3)*t)*x +_
... Integer(3)*t
>>> a.count_irreducible_divisors()
12
```

We illustrate that an irreducible polynomial in the center have in general a lot of irreducible divisors in the skew polynomial ring:

```
sage: Z.<x3> = S.center()
sage: N = x3^5 + 4*x3^4 + 4*x3^2 + 4*x3 + 3; N
x3^5 + 4*x3^4 + 4*x3^2 + 4*x3 + 3
sage: N.is_irreducible()
True
sage: S(N).count_irreducible_divisors()
9768751
```

```
>>> from sage.all import *
>>> Z = S.center(names=('x3',)); (x3,) = Z._first_ngens(1)
>>> N = x3**Integer(5) + Integer(4)*x3**Integer(4) +_
... Integer(4)*x3**Integer(2) + Integer(4)*x3 + Integer(3); N
x3^5 + 4*x3^4 + 4*x3^2 + 4*x3 + 3
>>> N.is_irreducible()
True
>>> S(N).count_irreducible_divisors()
9768751
```

### **factor (uniform=False)**

Return a factorization of this skew polynomial.

#### INPUT:

- uniform – boolean (default: False); whether the output irreducible divisor should be uniformly distributed among all possibilities

#### EXAMPLES:

```
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = x^3 + (t^2 + 4*t + 2)*x^2 + (3*t + 3)*x + t^2 + 1
sage: F = a.factor(); F    # random
```

(continues on next page)

(continued from previous page)

```
(x + t^2 + 4) * (x + t + 3) * (x + t)
sage: F.value() == a
True
```

```
>>> from sage.all import *
>>> k = GF(Integer(5)**Integer(3), names='t'); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = x**Integer(3) + (t**Integer(2) + Integer(4)*t +_
    -Integer(2))*x**Integer(2) + (Integer(3)*t + Integer(3))*x + t**Integer(2) +_
    -Integer(1)
>>> F = a.factor(); F      # random
(x + t^2 + 4) * (x + t + 3) * (x + t)
>>> F.value() == a
True
```

The result of the factorization is cached. Hence, if we try again to factor  $a$ , we will get the same answer:

```
sage: a.factor()      # random
(x + t^2 + 4) * (x + t + 3) * (x + t)
```

```
>>> from sage.all import *
>>> a.factor()      # random
(x + t^2 + 4) * (x + t + 3) * (x + t)
```

However, the algorithm is probabilistic. Hence if we first reinitialize  $a$ , we may get a different answer:

```
sage: a = x^3 + (t^2 + 4*t + 2)*x^2 + (3*t + 3)*x + t^2 + 1
sage: F = a.factor(); F      # random
(x + t^2 + t + 2) * (x + 2*t^2 + t + 4) * (x + t)
sage: F.value() == a
True
```

```
>>> from sage.all import *
>>> a = x**Integer(3) + (t**Integer(2) + Integer(4)*t +_
    -Integer(2))*x**Integer(2) + (Integer(3)*t + Integer(3))*x + t**Integer(2) +_
    -Integer(1)
>>> F = a.factor(); F      # random
(x + t^2 + t + 2) * (x + 2*t^2 + t + 4) * (x + t)
>>> F.value() == a
True
```

There is a priori no guarantee on the distribution of the factorizations we get. Passing in the keyword `uniform=True` ensures the output is uniformly distributed among all factorizations:

```
sage: a.factor(uniform=True)      # random
(x + t^2 + 4) * (x + t) * (x + t + 3)
sage: a.factor(uniform=True)      # random
(x + 2*t^2) * (x + t^2 + t + 1) * (x + t^2 + t + 2)
sage: a.factor(uniform=True)      # random
(x + 2*t^2 + 3*t) * (x + 4*t + 2) * (x + 2*t + 2)
```

```
>>> from sage.all import *
>>> a.factor(uniform=True)      # random
(x + t^2 + 4) * (x + t) * (x + t + 3)
>>> a.factor(uniform=True)      # random
(x + 2*t^2) * (x + t^2 + t + 1) * (x + t^2 + t + 2)
>>> a.factor(uniform=True)      # random
(x + 2*t^2 + 3*t) * (x + 4*t + 2) * (x + 2*t + 2)
```

By convention, the zero skew polynomial has no factorization:

```
sage: S(0).factor()
Traceback (most recent call last):
...
ValueError: factorization of 0 not defined
```

```
>>> from sage.all import *
>>> S(Integer(0)).factor()
Traceback (most recent call last):
...
ValueError: factorization of 0 not defined
```

### `factorizations()`

Return an iterator over all factorizations (as a product of a unit and a product of irreducible monic factors) of this skew polynomial.

#### EXAMPLES:

```
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = x^3 + (t^2 + 1)*x^2 + (2*t + 3)*x + t^2 + t + 2
sage: iter = a.factorizations(); iter
<...generator object at 0x...>
sage: next(iter)    # random
(x + 3*t^2 + 4*t) * (x + 2*t^2) * (x + 4*t^2 + 4*t + 2)
sage: next(iter)    # random
(x + 3*t^2 + 4*t) * (x + 3*t^2 + 2*t + 2) * (x + 4*t^2 + t + 2)
```

```
>>> from sage.all import *
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = x**Integer(3) + (t**Integer(2) + Integer(1))*x**Integer(2) +_
<- (Integer(2)*t + Integer(3))*x + t**Integer(2) + t + Integer(2)
>>> iter = a.factorizations(); iter
<...generator object at 0x...>
>>> next(iter)    # random
(x + 3*t^2 + 4*t) * (x + 2*t^2) * (x + 4*t^2 + 4*t + 2)
>>> next(iter)    # random
(x + 3*t^2 + 4*t) * (x + 3*t^2 + 2*t + 2) * (x + 4*t^2 + t + 2)
```

We can use this function to build the list of factorizations of  $a$ :

```
sage: factorizations = [ F for F in a.factorizations() ]
```

```
>>> from sage.all import *
>>> factorizations = [ F for F in a.factorizations() ]
```

We do some checks:

```
sage: len(factorizations) == a.count_factorizations()
True
sage: len(factorizations) == Set(factorizations).cardinality() # check no_
→duplicates
True
sage: for F in factorizations:
....:     assert F.value() == a, "factorization has a different value"
....:     for d,_ in F:
....:         assert d.is_irreducible(), "a factor is not irreducible"
```

```
>>> from sage.all import *
>>> len(factorizations) == a.count_factorizations()
True
>>> len(factorizations) == Set(factorizations).cardinality() # check no_
→duplicates
True
>>> for F in factorizations:
...     assert F.value() == a, "factorization has a different value"
...     for d,_ in F:
...         assert d.is_irreducible(), "a factor is not irreducible"
```

Note that the algorithm used in this method is probabilistic. As a consequence, if we call it two times with the same input, we can get different orderings:

```
sage: factorizations2 = [ F for F in a.factorizations() ]
sage: factorizations == factorizations2 # random
False
sage: sorted(factorizations) == sorted(factorizations2)
True
```

```
>>> from sage.all import *
>>> factorizations2 = [ F for F in a.factorizations() ]
>>> factorizations == factorizations2 # random
False
>>> sorted(factorizations) == sorted(factorizations2)
True
```

### `is_irreducible()`

Return True if this skew polynomial is irreducible.

EXAMPLES:

```
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
```

(continues on next page)

(continued from previous page)

```
sage: a = x^2 + t*x + 1
sage: a.is_irreducible()
False
sage: a.factor()
(x + 4*t^2 + 4*t + 1) * (x + 3*t + 2)

sage: a = x^2 + t*x + t + 1
sage: a.is_irreducible()
True
sage: a.factor()
x^2 + t*x + t + 1
```

```
>>> from sage.all import *
>>> k = GF(Integer(5)**Integer(3), names='t,); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)

>>> a = x**Integer(2) + t*x + Integer(1)
>>> a.is_irreducible()
False
>>> a.factor()
(x + 4*t^2 + 4*t + 1) * (x + 3*t + 2)

>>> a = x**Integer(2) + t*x + t + Integer(1)
>>> a.is_irreducible()
True
>>> a.factor()
x^2 + t*x + t + 1
```

Skew polynomials of degree 1 are of course irreducible:

```
sage: a = x + t
sage: a.is_irreducible()
True
```

```
>>> from sage.all import *
>>> a = x + t
>>> a.is_irreducible()
True
```

A random irreducible skew polynomial is irreducible:

```
sage: a = S.random_irreducible(degree=4,monic=True); a      # random
x^4 + (t + 1)*x^3 + (3*t^2 + 2*t + 3)*x^2 + 3*t*x + 3*t
sage: a.is_irreducible()
True
```

```
>>> from sage.all import *
>>> a = S.random_irreducible(degree=Integer(4),monic=True); a      # random
x^4 + (t + 1)*x^3 + (3*t^2 + 2*t + 3)*x^2 + 3*t*x + 3*t
>>> a.is_irreducible()
True
```

By convention, constant skew polynomials are not irreducible:

```
sage: S(1).is_irreducible()
False
sage: S(0).is_irreducible()
False
```

```
>>> from sage.all import *
>>> S(Integer(1)).is_irreducible()
False
>>> S(Integer(0)).is_irreducible()
False
```

### `left_irreducible_divisor(uniform=False)`

Return a left irreducible divisor of this skew polynomial.

INPUT:

- `uniform` – boolean (default: `False`); whether the output irreducible divisor should be uniformly distributed among all possibilities

EXAMPLES:

```
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = x^6 + 3*t*x^5 + (3*t + 1)*x^3 + (4*t^2 + 3*t + 4)*x^2 + (t^2 + 2)*x^
      ↪+ 4*t^2 + 3*t + 3
sage: dl = a.left_irreducible_divisor(); dl  # random
x^3 + (t^2 + t + 2)*x^2 + (t + 2)*x + 3*t^2 + t + 4
sage: a.is_left_divisible_by(dl)
True
```

```
>>> from sage.all import *
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = x**Integer(6) + Integer(3)*t*x**Integer(5) + (Integer(3)*t +
      ↪Integer(1))*x**Integer(3) + (Integer(4)*t**Integer(2) + Integer(3)*t +
      ↪Integer(4))*x**Integer(2) + (t**Integer(2) + Integer(2))*x +
      ↪Integer(4)*t**Integer(2) + Integer(3)*t + Integer(3)
>>> dl = a.left_irreducible_divisor(); dl  # random
x^3 + (t^2 + t + 2)*x^2 + (t + 2)*x + 3*t^2 + t + 4
>>> a.is_left_divisible_by(dl)
True
```

The algorithm is probabilistic. Hence, if we ask again for a left irreducible divisor of  $a$ , we may get a different answer:

```
sage: a.left_irreducible_divisor()  # random
x^3 + (4*t + 3)*x^2 + (2*t^2 + 3*t + 4)*x + 4*t^2 + 2*t
```

```
>>> from sage.all import *
>>> a.left_irreducible_divisor()  # random
x^3 + (4*t + 3)*x^2 + (2*t^2 + 3*t + 4)*x + 4*t^2 + 2*t
```

We can also generate uniformly distributed irreducible monic divisors as follows:

```
sage: a.left_irreducible_divisor(uniform=True) # random
x^3 + (4*t^2 + 3*t + 4)*x^2 + (t^2 + t + 3)*x + 2*t^2 + 3
sage: a.left_irreducible_divisor(uniform=True) # random
x^3 + (2*t^2 + t + 4)*x^2 + (2*t^2 + 4*t + 4)*x + 2*t + 3
sage: a.left_irreducible_divisor(uniform=True) # random
x^3 + (t^2 + t + 2)*x^2 + (3*t^2 + t)*x + 2*t + 1
```

```
>>> from sage.all import *
>>> a.left_irreducible_divisor(uniform=True) # random
x^3 + (4*t^2 + 3*t + 4)*x^2 + (t^2 + t + 3)*x + 2*t^2 + 3
>>> a.left_irreducible_divisor(uniform=True) # random
x^3 + (2*t^2 + t + 4)*x^2 + (2*t^2 + 4*t + 4)*x + 2*t + 3
>>> a.left_irreducible_divisor(uniform=True) # random
x^3 + (t^2 + t + 2)*x^2 + (3*t^2 + t)*x + 2*t + 1
```

By convention, the zero skew polynomial has no irreducible divisor:

```
sage: S(0).left_irreducible_divisor()
Traceback (most recent call last):
...
ValueError: 0 has no irreducible divisor
```

```
>>> from sage.all import *
>>> S(Integer(0)).left_irreducible_divisor()
Traceback (most recent call last):
...
ValueError: 0 has no irreducible divisor
```

### `left_irreducible_divisors()`

Return an iterator over all irreducible monic left divisors of this skew polynomial.

EXAMPLES:

```
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = x^4 + 2*t*x^3 + 3*t^2*x^2 + (t^2 + t + 1)*x + 4*t + 3
sage: iter = a.left_irreducible_divisors(); iter
<...generator object at 0x...>
sage: next(iter) # random
x + 3*t + 3
sage: next(iter) # random
x + 4*t + 2
```

```
>>> from sage.all import *
>>> k = GF(Integer(5)**Integer(3), names='t,); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = x**Integer(4) + Integer(2)*t*x**Integer(3) +
... Integer(3)*t**Integer(2)*x**Integer(2) + (t**Integer(2) + t + Integer(1))*x +
... + Integer(4)*t + Integer(3)
```

(continues on next page)

(continued from previous page)

```
>>> iter = a.left_irreducible_divisors(); iter
<...generator object at 0x...>
>>> next(iter) # random
x + 3*t + 3
>>> next(iter) # random
x + 4*t + 2
```

We can use this function to build the list of all monic irreducible divisors of  $a$ :

```
sage: leftdiv = [ d for d in a.left_irreducible_divisors() ]
```

```
>>> from sage.all import *
>>> leftdiv = [ d for d in a.left_irreducible_divisors() ]
```

Note that the algorithm is probabilistic. As a consequence, if we build again the list of left monic irreducible divisors of  $a$ , we may get a different ordering:

```
sage: leftdiv2 = [ d for d in a.left_irreducible_divisors() ]
sage: Set(leftdiv) == Set(leftdiv2)
True
```

```
>>> from sage.all import *
>>> leftdiv2 = [ d for d in a.left_irreducible_divisors() ]
>>> Set(leftdiv) == Set(leftdiv2)
True
```

### `right_irreducible_divisor(uniform=False)`

Return a right irreducible divisor of this skew polynomial.

INPUT:

- `uniform` – boolean (default: `False`); whether the output irreducible divisor should be uniformly distributed among all possibilities

EXAMPLES:

```
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = x^6 + 3*t*x^5 + (3*t + 1)*x^3 + (4*t^2 + 3*t + 4)*x^2 + (t^2 + 2)*x^_
+ 4*t^2 + 3*t + 3

sage: dr = a.right_irreducible_divisor(); dr # random
x^3 + (2*t^2 + t + 4)*x^2 + (4*t + 1)*x + 4*t^2 + t + 1
sage: a.is_right_divisible_by(dr)
True
```

```
>>> from sage.all import *
>>> k = GF(Integer(5)**Integer(3), names='t,); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = x**Integer(6) + Integer(3)*t*x**Integer(5) + (Integer(3)*t +_
+ Integer(1))*x**Integer(3) + (Integer(4)*t**Integer(2) + Integer(3)*t +
```

(continues on next page)

(continued from previous page)

```

→ Integer(4)*x**Integer(2) + (t**Integer(2) + Integer(2))*x +
→ Integer(4)*t**Integer(2) + Integer(3)*t + Integer(3)

>>> dr = a.right_irreducible_divisor(); dr  # random
x^3 + (2*t^2 + t + 4)*x^2 + (4*t + 1)*x + 4*t^2 + t + 1
>>> a.is_right_divisible_by(dr)
True

```

Right divisors are cached. Hence, if we ask again for a right divisor, we will get the same answer:

```

sage: a.right_irreducible_divisor()  # random
x^3 + (2*t^2 + t + 4)*x^2 + (4*t + 1)*x + 4*t^2 + t + 1

>>> from sage.all import *
>>> a.right_irreducible_divisor()  # random
x^3 + (2*t^2 + t + 4)*x^2 + (4*t + 1)*x + 4*t^2 + t + 1

```

However the algorithm is probabilistic. Hence, if we first reinitialize  $a$ , we may get a different answer:

```

sage: a = x^6 + 3*t*x^5 + (3*t + 1)*x^3 + (4*t^2 + 3*t + 4)*x^2 + (t^2 + 2)*x +
→ 4*t^2 + 3*t + 3
sage: a.right_irreducible_divisor()  # random
x^3 + (t^2 + 3*t + 4)*x^2 + (t + 2)*x + 4*t^2 + t + 1

>>> from sage.all import *
>>> a = x**Integer(6) + Integer(3)*t*x**Integer(5) + (Integer(3)*t +
→ Integer(1))*x**Integer(3) + (Integer(4)*t**Integer(2) + Integer(3)*t +
→ Integer(4))*x**Integer(2) + (t**Integer(2) + Integer(2))*x +
→ Integer(4)*t**Integer(2) + Integer(3)*t + Integer(3)
>>> a.right_irreducible_divisor()  # random
x^3 + (t^2 + 3*t + 4)*x^2 + (t + 2)*x + 4*t^2 + t + 1

```

We can also generate uniformly distributed irreducible monic divisors as follows:

```

sage: a.right_irreducible_divisor(uniform=True)  # random
x^3 + (4*t + 2)*x^2 + (2*t^2 + 2*t + 2)*x + 2*t^2 + 2
sage: a.right_irreducible_divisor(uniform=True)  # random
x^3 + (t^2 + 2)*x^2 + (3*t^2 + 1)*x + 4*t^2 + 2*t
sage: a.right_irreducible_divisor(uniform=True)  # random
x^3 + x^2 + (4*t^2 + 2*t + 4)*x + t^2 + 3

>>> from sage.all import *
>>> a.right_irreducible_divisor(uniform=True)  # random
x^3 + (4*t + 2)*x^2 + (2*t^2 + 2*t + 2)*x + 2*t^2 + 2
>>> a.right_irreducible_divisor(uniform=True)  # random
x^3 + (t^2 + 2)*x^2 + (3*t^2 + 1)*x + 4*t^2 + 2*t
>>> a.right_irreducible_divisor(uniform=True)  # random
x^3 + x^2 + (4*t^2 + 2*t + 4)*x + t^2 + 3

```

By convention, the zero skew polynomial has no irreducible divisor:

```
sage: S(0).right_irreducible_divisor()
Traceback (most recent call last):
...
ValueError: 0 has no irreducible divisor
```

```
>>> from sage.all import *
>>> S(Integer(0)).right_irreducible_divisor()
Traceback (most recent call last):
...
ValueError: 0 has no irreducible divisor
```

**right\_irreducible\_divisors()**

Return an iterator over all irreducible monic right divisors of this skew polynomial.

**EXAMPLES:**

```
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: a = x^4 + 2*t*x^3 + 3*t^2*x^2 + (t^2 + t + 1)*x + 4*t + 3
sage: iter = a.right_irreducible_divisors(); iter
<...generator object at 0x...>
sage: next(iter)    # random
x + 2*t^2 + 4*t + 4
sage: next(iter)    # random
x + 3*t^2 + 4*t + 1
```

```
>>> from sage.all import *
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> a = x**Integer(4) + Integer(2)*t*x**Integer(3) +
...>      Integer(3)*t**Integer(2)*x**Integer(2) + (t**Integer(2) + t + Integer(1))*x +
...>      Integer(4)*t + Integer(3)
>>> iter = a.right_irreducible_divisors(); iter
<...generator object at 0x...>
>>> next(iter)    # random
x + 2*t^2 + 4*t + 4
>>> next(iter)    # random
x + 3*t^2 + 4*t + 1
```

We can use this function to build the list of all monic irreducible divisors of  $a$ :

```
sage: rightdiv = [ d for d in a.right_irreducible_divisors() ]
```

```
>>> from sage.all import *
>>> rightdiv = [ d for d in a.right_irreducible_divisors() ]
```

Note that the algorithm is probabilistic. As a consequence, if we build again the list of right monic irreducible divisors of  $a$ , we may get a different ordering:

```
sage: rightdiv2 = [ d for d in a.right_irreducible_divisors() ]
sage: rightdiv == rightdiv2
```

(continues on next page)

(continued from previous page)

```
False
sage: Set(rightdiv) == Set(rightdiv2)
True
```

```
>>> from sage.all import *
>>> rightdiv2 = [ d for d in a.right_irreducible_divisors() ]
>>> rightdiv == rightdiv2
False
>>> Set(rightdiv) == Set(rightdiv2)
True
```

**type(N)**

Return the  $N$ -type of this skew polynomial (see definition below).

INPUT:

- $N$  – an irreducible polynomial in the center of the underlying skew polynomial ring

**Note**

The result is cached.

DEFINITION:

The  $N$ -type of a skew polynomial  $a$  is the Partition  $(t_0, t_1, t_2, \dots)$  defined by

$$t_0 + \cdots + t_i = \frac{\deg \gcd(a, N^i)}{\deg N},$$

where  $\deg N$  is the degree of  $N$  considered as an element in the center.

This notion has an important mathematical interest because it corresponds to the Jordan type of the  $N$ -typical part of the associated Galois representation.

EXAMPLES:

```
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: Z = S.center(); x3 = Z.gen()

sage: a = x^4 + x^3 + (4*t^2 + 4)*x^2 + (t^2 + 2)*x + 4*t^2
sage: N = x3^2 + x3 + 1
sage: a.type(N)
[1]
sage: N = x3 + 1
sage: a.type(N)
[2]

sage: a = x^3 + (3*t^2 + 1)*x^2 + (3*t^2 + t + 1)*x + t + 1
sage: N = x3 + 1
sage: a.type(N)
[2, 1]
```

```

>>> from sage.all import *
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> Z = S.center(); x3 = Z.gen()

>>> a = x**Integer(4) + x**Integer(3) + (Integer(4)*t**Integer(2) +_
    - Integer(4))*x**Integer(2) + (t**Integer(2) + Integer(2))*x +_
    - Integer(4)*t**Integer(2)
>>> N = x3**Integer(2) + x3 + Integer(1)
>>> a.type(N)
[1]
>>> N = x3 + Integer(1)
>>> a.type(N)
[2]

>>> a = x**Integer(3) + (Integer(3)*t**Integer(2) + Integer(1))*x**Integer(2) -_
    - (Integer(3)*t**Integer(2) + t + Integer(1))*x + t + Integer(1)
>>> N = x3 + Integer(1)
>>> a.type(N)
[2, 1]

```

If  $N$  does not divide the reduced map of  $a$ , the type is empty:

```

sage: N = x3 + 2
sage: a.type(N)
[]

```

```

>>> from sage.all import *
>>> N = x3 + Integer(2)
>>> a.type(N)
[]

```

If  $a = N$ , the type is just  $[r]$  where  $r$  is the order of the twisting morphism  $\text{Frob}$ :

```

sage: N = x3^2 + x3 + 1
sage: S(N).type(N)
[3]

```

```

>>> from sage.all import *
>>> N = x3**Integer(2) + x3 + Integer(1)
>>> S(N).type(N)
[3]

```

$N$  must be irreducible:

```

sage: N = (x3 + 1) * (x3 + 2)
sage: a.type(N)
Traceback (most recent call last):
...
ValueError: N is not irreducible

```

```
>>> from sage.all import *
>>> N = (x3 + Integer(1)) * (x3 + Integer(2))
>>> a.type(N)
Traceback (most recent call last):
...
ValueError: N is not irreducible
```

## 1.7 Fraction fields of Ore polynomial rings

Sage provides support for building the fraction field of any Ore polynomial ring and performing basic operations in it. The fraction field is constructed by the method `sage.rings.polynomial.ore_polynomial_ring.OrePolynomialRing.fraction_field()` as demonstrated below:

```
sage: R.<t> = QQ[]
sage: der = R.derivation()
sage: A.<d> = R['d', der]
sage: K = A.fraction_field()
sage: K
Ore Function Field in d over Fraction Field of Univariate Polynomial Ring in t
over Rational Field twisted by d/dt
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> der = R.derivation()
>>> A = R['d', der]; (d,) = A._first_ngens(1)
>>> K = A.fraction_field()
>>> K
Ore Function Field in d over Fraction Field of Univariate Polynomial Ring in t
over Rational Field twisted by d/dt
```

The simplest way to build elements in  $K$  is to use the division operator over Ore polynomial rings:

```
sage: f = 1/d
sage: f
d^(-1)
sage: f.parent() is K
True
```

```
>>> from sage.all import *
>>> f = Integer(1)/d
>>> f
d^(-1)
>>> f.parent() is K
True
```

### REPRESENTATION OF ELEMENTS:

Elements in  $K$  are internally represented by fractions of the form  $s^{-1}t$  with the denominator on the left. Notice that, because of noncommutativity, this is not the same that fractions with denominator on the right. For example, a fraction created by the division operator is usually displayed with a different numerator and/or a different denominator:

```
sage: g = t / d
sage: g
(d - 1/t)^(-1) * t
```

```
>>> from sage.all import *
>>> g = t / d
>>> g
(d - 1/t)^(-1) * t
```

The left numerator and right denominator are accessible as follows:

```
sage: g.left_numerator()
t
sage: g.right_denominator()
d
```

```
>>> from sage.all import *
>>> g.left_numerator()
t
>>> g.right_denominator()
d
```

Similarly the methods `OrePolynomial.left_denominator()` and `OrePolynomial.right_numerator()` give access to the Ore polynomials  $s$  and  $t$  in the representation  $s^{-1}t$ :

```
sage: g.left_denominator()
d - 1/t
sage: g.right_numerator()
t
```

```
>>> from sage.all import *
>>> g.left_denominator()
d - 1/t
>>> g.right_numerator()
t
```

We favored the writing  $s^{-1}t$  because it always exists. On the contrary, the writing  $st^{-1}$  is only guaranteed when the twisting morphism defining the Ore polynomial ring is bijective. As a consequence, when the latter assumption is not fulfilled (or actually if Sage cannot invert the twisting morphism), computing the left numerator and the right denominator fails:

```
sage: # needs sage.rings.function_field
sage: sigma = R.hom([t^2])
sage: S.<x> = R['x', sigma]
sage: F = S.fraction_field()
sage: f = F.random_element()
sage: while not f:
....:     f = F.random_element()
sage: f.left_numerator()
Traceback (most recent call last):
...
NotImplementedError: inversion of the twisting morphism
```

(continues on next page)

(continued from previous page)

```
Ring endomorphism of Fraction Field of Univariate Polynomial Ring in t over Rational
↪Field
Defn: t |--> t^2
```

```
>>> from sage.all import *
>>> # needs sage.rings.function_field
>>> sigma = R.hom([t**Integer(2)])
>>> S = R['x', sigma]; (x,) = S._first_ngens(1)
>>> F = S.fraction_field()
>>> f = F.random_element()
>>> while not f:
...     f = F.random_element()
>>> f.left_numerator()
Traceback (most recent call last):
...
NotImplementedError: inversion of the twisting morphism
Ring endomorphism of Fraction Field of Univariate Polynomial Ring in t over Rational
↪Field
Defn: t |--> t^2
```

On a related note, fractions are systematically simplified when the twisting morphism is bijective but they are not otherwise. As an example, compare the two following computations:

```
sage: # needs sage.rings.function_field
sage: P = d^2 + t*d + 1
sage: Q = d + t^2
sage: D = d^3 + t^2 + 1
sage: f = P^(-1) * Q
sage: f
(d^2 + t*d + 1)^(-1) * (d + t^2)
sage: g = (D*P)^(-1) * (D*Q)
sage: g
(d^2 + t*d + 1)^(-1) * (d + t^2)

sage: # needs sage.rings.function_field
sage: P = x^2 + t*x + 1
sage: Q = x + t^2
sage: D = x^3 + t^2 + 1
sage: f = P^(-1) * Q
sage: f
(x^2 + t*x + 1)^(-1) * (x + t^2)
sage: g = (D*P)^(-1) * (D*Q)
sage: g
(x^5 + t^8*x^4 + x^3 + (t^2 + 1)*x^2 + (t^3 + t)*x + t^2 + 1)^(-1)
* (x^4 + t^16*x^3 + (t^2 + 1)*x + t^4 + t^2)
sage: f == g
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.function_field
>>> P = d**Integer(2) + t*d + Integer(1)
>>> Q = d + t**Integer(2)
```

(continues on next page)

(continued from previous page)

```
>>> D = d**Integer(3) + t**Integer(2) + Integer(1)
>>> f = P**(-Integer(1)) * Q
>>> f
(d^2 + t*d + 1)^(-1) * (d + t^2)
>>> g = (D*P)**(-Integer(1)) * (D*Q)
>>> g
(d^2 + t*d + 1)^(-1) * (d + t^2)

>>> # needs sage.rings.function_field
>>> P = x**Integer(2) + t*x + Integer(1)
>>> Q = x + t**Integer(2)
>>> D = x**Integer(3) + t**Integer(2) + Integer(1)
>>> f = P**(-Integer(1)) * Q
>>> f
(x^2 + t*x + 1)^(-1) * (x + t^2)
>>> g = (D*P)**(-Integer(1)) * (D*Q)
>>> g
(x^5 + t^8*x^4 + x^3 + (t^2 + 1)*x^2 + (t^3 + t)*x + t^2 + 1)^(-1)
* (x^4 + t^16*x^3 + (t^2 + 1)*x + t^4 + t^2)
>>> f == g
True
```

## OPERATIONS:

Basic arithmetical operations are available:

```
sage: # needs sage.rings.function_field
sage: f = 1 / d
sage: g = 1 / (d + t)
sage: u = f + g; u
(d^2 + ((t^2 - 1)/t)*d)^(-1) * (2*d + (t^2 - 2)/t)
sage: v = f - g; v
(d^2 + ((t^2 - 1)/t)*d)^(-1) * t
sage: u + v
d^(-1) * 2

sage: f * g
(d^2 + t*d)^(-1)
sage: f / g
d^(-1) * (d + t)
```

```
>>> from sage.all import *
>>> # needs sage.rings.function_field
>>> f = Integer(1) / d
>>> g = Integer(1) / (d + t)
>>> u = f + g; u
(d^2 + ((t^2 - 1)/t)*d)^(-1) * (2*d + (t^2 - 2)/t)
>>> v = f - g; v
(d^2 + ((t^2 - 1)/t)*d)^(-1) * t
>>> u + v
d^(-1) * 2
```

(continues on next page)

(continued from previous page)

```
>>> f * g
(d^2 + t*d)^(-1)
>>> f / g
d^(-1) * (d + t)
```

Of course, multiplication remains noncommutative:

```
sage: # needs sage.rings.function_field
sage: g * f
(d^2 + t*d + 1)^(-1)
sage: g^(-1) * f
(d - 1/t)^(-1) * (d + (t^2 - 1)/t)
```

```
>>> from sage.all import *
>>> # needs sage.rings.function_field
>>> g * f
(d^2 + t*d + 1)^(-1)
>>> g**(-Integer(1)) * f
(d - 1/t)^(-1) * (d + (t^2 - 1)/t)
```

#### AUTHOR:

- Xavier Caruso (2020-05)

```
class sage.rings.polynomial.ore_function_field.OreFunctionCenterInjection(domain,
codomain,
ringembed)
```

Bases: `RingHomomorphism`

Canonical injection of the center of a Ore function field into this field.

`section()`

Return a section of this morphism.

#### EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<a> = GF(5^3)
sage: S.<x> = SkewPolynomialRing(k, k.frobenius_endomorphism())
sage: K = S.fraction_field()
sage: Z = K.center()
sage: iota = K.coerce_map_from(Z)
sage: sigma = iota.section()
sage: sigma(x^3 / (x^6 + 1))
z/(z^2 + 1)
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='a,'); (a,) = k._first_ngens(1)
>>> S = SkewPolynomialRing(k, k.frobenius_endomorphism(), names='x,'); (x,) =
>>> S._first_ngens(1)
>>> K = S.fraction_field()
>>> Z = K.center()
>>> iota = K.coerce_map_from(Z)
```

(continues on next page)

(continued from previous page)

```
>>> sigma = iota.section()
>>> sigma(x**Integer(3) / (x**Integer(6) + Integer(1)))
z/(z^2 + 1)
```

**class** sage.rings.polynomial.ore\_function\_field.**OreFunctionField**(*ring*, *category=None*)

Bases: Parent, UniqueRepresentation

A class for fraction fields of Ore polynomial rings.

**Element** = None

**change\_var** (*var*)

Return the Ore function field in variable *var* with the same base ring, twisting morphism and twisting derivation as *self*.

INPUT:

- *var* – string representing the name of the new variable

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: R.<x> = OrePolynomialRing(k,Frob)
sage: K = R.fraction_field()
sage: K
Ore Function Field in x over Finite Field in t of size 5^3 twisted by t |-->_
˓→t^5
sage: Ky = K.change_var('y'); Ky
Ore Function Field in y over Finite Field in t of size 5^3 twisted by t |-->_
˓→t^5
sage: Ky is K.change_var('y')
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> R = OrePolynomialRing(k,Frob, names=('x',)); (x,) = R._first_ngens(1)
>>> K = R.fraction_field()
>>> K
Ore Function Field in x over Finite Field in t of size 5^3 twisted by t |-->_
˓→t^5
>>> Ky = K.change_var('y'); Ky
Ore Function Field in y over Finite Field in t of size 5^3 twisted by t |-->_
˓→t^5
>>> Ky is K.change_var('y')
True
```

**characteristic()**

Return the characteristic of this Ore function field.

EXAMPLES:

```

sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S = R['x',sigma]
sage: S.fraction_field().characteristic()          #_
˓needs sage.rings.function_field
0

sage: # needs sage.rings.finite_rings
sage: k.<u> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S = k['y',Frob]
sage: S.fraction_field().characteristic()          #_
˓needs sage.rings.function_field
5

```

```

>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]
>>> S.fraction_field().characteristic()          #_
˓needs sage.rings.function_field
0

>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=(‘u’,)); (u,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['y',Frob]
>>> S.fraction_field().characteristic()          #_
˓needs sage.rings.function_field
5

```

**fraction\_field()**

Return the fraction field of this Ore function field, i.e. this Ore function field itself.

**EXAMPLES:**

```

sage: R.<t> = QQ[]
sage: der = R.derivation()
sage: A.<d> = R['d', der]
sage: K = A.fraction_field(); K
Ore Function Field in d
over Fraction Field of Univariate Polynomial Ring in t over Rational Field
twisted by d/dt
sage: K.fraction_field()
Ore Function Field in d
over Fraction Field of Univariate Polynomial Ring in t over Rational Field
twisted by d/dt
sage: K.fraction_field() is K
True

```

```

>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> der = R.derivation()

```

(continues on next page)

(continued from previous page)

```
>>> A = R['d', der]; (d,) = A._first_ngens(1)
>>> K = A.fraction_field(); K
Ore Function Field in d
over Fraction Field of Univariate Polynomial Ring in t over Rational Field
twisted by d/dt
>>> K.fraction_field()
Ore Function Field in d
over Fraction Field of Univariate Polynomial Ring in t over Rational Field
twisted by d/dt
>>> K.fraction_field() is K
True
```

**gen (n=0)**

Return the indeterminate generator of this Ore function field.

**INPUT:**

- n – index of generator to return (default: 0); exists for compatibility with other polynomial rings

**EXAMPLES:**

```
sage: # needs sage.rings.finite_rings
sage: k.<a> = GF(5^4)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: K = S.fraction_field()
sage: K.gen()
x
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(4), names=('a',)); (a,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> K = S.fraction_field()
>>> K.gen()
x
```

**gens ()**

Return the tuple of generators of self.

**EXAMPLES:**

```
sage: # needs sage.rings.finite_rings
sage: k.<a> = GF(5^4)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: K = S.fraction_field()
sage: K.gens()
(x,)
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
```

(continues on next page)

(continued from previous page)

```
>>> k = GF(Integer(5)**Integer(4), names=('a',)); (a,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> K = S.fraction_field()
>>> K.gens()
(x,)
```

**gens\_dict()**

Return a {name: variable} dictionary of the generators of this Ore function field.

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: R.<t> = ZZ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = OrePolynomialRing(R, sigma)
sage: K = S.fraction_field()
sage: K.gens_dict()
{'x': x}
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = OrePolynomialRing(R, sigma, names=('x',)); (x,) = S._first_ngens(1)
>>> K = S.fraction_field()
>>> K.gens_dict()
{'x': x}
```

**is\_exact()**

Return True if elements of this Ore function field are exact. This happens if and only if elements of the base ring are exact.

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: K = S.fraction_field()
sage: K.is_exact()
True

sage: # needs sage.rings.padics
sage: k.<u> = Qq(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: K = S.fraction_field()
sage: K.is_exact()
False
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
```

(continues on next page)

(continued from previous page)

```
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> K = S.fraction_field()
>>> K.is_exact()
True

>>> # needs sage.rings.padics
>>> k = Qq(Integer(5)**Integer(3), names=('u',)); (u,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> K = S.fraction_field()
>>> K.is_exact()
False
```

**is\_field(*proof=False*)**

Return always True since Ore function field are (skew) fields.

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<a> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: K = S.fraction_field()
sage: S.is_field()
False
sage: K.is_field()
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=('a',)); (a,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> K = S.fraction_field()
>>> S.is_field()
False
>>> K.is_field()
True
```

**is\_finite()**

Return False since Ore function field are not finite.

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: k.is_finite()
True
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: K = S.fraction_field()
```

(continues on next page)

(continued from previous page)

```
sage: K.is_finite()
False
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> k.is_finite()
True
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> K = S.fraction_field()
>>> K.is_finite()
False
```

**is\_sparse()**

Return `True` if the elements of this Ore function field are sparsely represented.

**⚠ Warning**

Since sparse Ore polynomials are not yet implemented, this function always returns `False`.

**EXAMPLES:**

```
sage: # needs sage.rings.function_field sage.rings.real_mpfr
sage: R.<t> = RR[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x', sigma]
sage: K = S.fraction_field()
sage: K.is_sparse()
False
```

```
>>> from sage.all import *
>>> # needs sage.rings.function_field sage.rings.real_mpfr
>>> R = RR['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x', sigma]; (x,) = S._first_ngens(1)
>>> K = S.fraction_field()
>>> K.is_sparse()
False
```

**ngens()**

Return the number of generators of this Ore function field, which is 1.

**EXAMPLES:**

```
sage: # needs sage.rings.function_field sage.rings.real_mpfr
sage: R.<t> = RR[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x', sigma]
sage: K = S.fraction_field()
```

(continues on next page)

(continued from previous page)

```
sage: K.ngens()
1
```

```
>>> from sage.all import *
>>> # needs sage.rings.function_field sage.rings.real_mpfr
>>> R = RR['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
>>> S = R['x',sigma]; (x,) = S._first_ngens(1)
>>> K = S.fraction_field()
>>> K.ngens()
1
```

**parameter (n=0)**

Return the indeterminate generator of this Ore function field.

**INPUT:**

- n – index of generator to return (default: 0); exists for compatibility with other polynomial rings

**EXAMPLES:**

```
sage: # needs sage.rings.finite_rings
sage: k.<a> = GF(5^4)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: K = S.fraction_field()
sage: K.gen()
```

```
x
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(4), names='a'); (a,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> K = S.fraction_field()
>>> K.gen()
```

```
x
```

**random\_element (degree=2, monic=False, \*args, \*\*kwds)**

Return a random Ore function in this field.

**INPUT:**

- degree – (default: 2) an integer or a list of two integers; the degrees of the denominator and numerator
- monic – boolean (default: False); if True, return a monic Ore function with monic numerator and denominator
- \*args, \*\*kwds – passed in to the `random_element()` method for the base ring

**EXAMPLES:**

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
```

(continues on next page)

(continued from previous page)

```
sage: S.<x> = k['x', Frob]
sage: K = S.fraction_field()
sage: K.random_element()          # random
(x^2 + (2*t^2 + t + 1)*x + 2*t^2 + 2*t + 3)^(-1)
* ((2*t^2 + 3)*x^2 + (4*t^2 + t + 4)*x + 2*t^2 + 2)
sage: K.random_element(monic=True) # random
(x^2 + (4*t^2 + 3*t + 4)*x + 4*t^2 + t)^(-1)
* (x^2 + (2*t^2 + t + 3)*x + 3*t^2 + t + 2)
sage: K.random_element(degree=3)   # random
(x^3 + (2*t^2 + 3)*x^2 + (2*t^2 + 4)*x + t + 3)^(-1)
* ((t + 4)*x^3 + (4*t^2 + 2*t + 2)*x^2 + (2*t^2 + 3*t + 3)*x + 3*t^2 + 3*t + 1)
sage: K.random_element(degree=[2,5]) # random
(x^2 + (4*t^2 + 2*t + 2)*x + 4*t^2 + t + 2)^(-1)
* ((3*t^2 + t + 1)*x^5 + (2*t^2 + 2*t)*x^4 + (t^2 + 2*t + 4)*x^3
+ (3*t^2 + 2*t)*x^2 + (t^2 + t + 4)*x)
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='t,); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> K = S.fraction_field()
>>> K.random_element()          # random
(x^2 + (2*t^2 + t + 1)*x + 2*t^2 + 2*t + 3)^(-1)
* ((2*t^2 + 3)*x^2 + (4*t^2 + t + 4)*x + 2*t^2 + 2)
>>> K.random_element(monic=True) # random
(x^2 + (4*t^2 + 3*t + 4)*x + 4*t^2 + t)^(-1)
* (x^2 + (2*t^2 + t + 3)*x + 3*t^2 + t + 2)
>>> K.random_element(degree=Integer(3)) # random
(x^3 + (2*t^2 + 3)*x^2 + (2*t^2 + 4)*x + t + 3)^(-1)
* ((t + 4)*x^3 + (4*t^2 + 2*t + 2)*x^2 + (2*t^2 + 3*t + 3)*x + 3*t^2 + 3*t + 1)
>>> K.random_element(degree=[Integer(2), Integer(5)]) # random
(x^2 + (4*t^2 + 2*t + 2)*x + 4*t^2 + t + 2)^(-1)
* ((3*t^2 + t + 1)*x^5 + (2*t^2 + 2*t)*x^4 + (t^2 + 2*t + 4)*x^3
+ (3*t^2 + 2*t)*x^2 + (t^2 + t + 4)*x)
```

**twisting\_derivation()**

Return the twisting derivation defining this Ore function field or `None` if this Ore function field is not twisted by a derivation.

**EXAMPLES:**

```
sage: R.<t> = QQ[]
sage: der = R.derivation(); der
d/dt
sage: A.<d> = R['d', der]
sage: F = A.fraction_field()
sage: F.twisting_derivation()
d/dt
```

(continues on next page)

(continued from previous page)

```
sage: # needs sage.rings.finite_rings
sage: k.<a> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: K = S.fraction_field()
sage: K.twisting_derivation()
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> der = R.derivation(); der
d/dt
>>> A = R['d', der]; (d,) = A._first_ngens(1)
>>> F = A.fraction_field()
>>> F.twisting_derivation()
d/dt

>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='a'); (a,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> K = S.fraction_field()
>>> K.twisting_derivation()
```

### See also

`sage.rings.polynomial.ore_polynomial_element.OrePolynomial.twisting_derivation(), twisting_morphism()`

#### `twisting_morphism(n=1)`

Return the twisting endomorphism defining this Ore function field iterated `n` times or `None` if this Ore function field is not twisted by an endomorphism.

INPUT:

- `n` – integer (default: 1)

EXAMPLES:

```
sage: R.<t> = QQ[]
sage: sigma = R.hom([t+1])
sage: S.<x> = R['x', sigma]
sage: K = S.fraction_field() #_
sage: K.twisting_morphism() #_
Ring endomorphism of
Fraction Field of Univariate Polynomial Ring in t over Rational Field
Defn: t |--> t + 1
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> sigma = R.hom([t+Integer(1)])
```

(continues on next page)

(continued from previous page)

```
>>> S = R['x', sigma]; (x,) = S._first_ngens(1)
>>> K = S.fraction_field()                                     #_
˓needs sage.rings.function_field
>>> K.twisting_morphism()                                    #_
˓needs sage.rings.function_field
Ring endomorphism of
Fraction Field of Univariate Polynomial Ring in t over Rational Field
Defn: t |--> t + 1
```

When the Ore polynomial ring is only twisted by a derivation, this method returns nothing:

```
sage: der = R.derivation()
sage: A.<der> = R['x', der]
sage: F = A.fraction_field()                                     #_
˓needs sage.rings.function_field
sage: F.twisting_morphism()                                    #_
˓needs sage.rings.function_field
```

```
>>> from sage.all import *
>>> der = R.derivation()
>>> A = R['x', der]; (d,) = A._first_ngens(1)
>>> F = A.fraction_field()                                     #_
˓needs sage.rings.function_field
>>> F.twisting_morphism()                                    #_
˓needs sage.rings.function_field
```

### See also

`sage.rings.polynomial.ore_polynomial_element.OrePolynomial.  
twisting_morphism(), twisting_derivation()`

```
class sage.rings.polynomial.ore_function_field.OreFunctionField_with_large_center(ring,
category=None)
```

Bases: `OreFunctionField`

A specialized class for Ore polynomial fields whose center has finite index.

`center(name=None, names=None, default=False)`

Return the center of this Ore function field.

### Note

One can prove that the center is a field of rational functions over a subfield of the base ring of this Ore function field.

INPUT:

- `name` – string or `None` (default: `None`); the name for the central variable
- `default` – boolean (default: `False`); if `True`, set the default variable name for the center to `name`

## EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: K = S.fraction_field()
sage: Z = K.center(); Z
Fraction Field of Univariate Polynomial Ring in z over Finite Field of size 5
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='t,); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> K = S.fraction_field()
>>> Z = K.center(); Z
Fraction Field of Univariate Polynomial Ring in z over Finite Field of size 5
```

We can pass in another variable name:

```
sage: K.center(name='y') #_
→needs sage.rings.finite_rings
Fraction Field of Univariate Polynomial Ring in y over Finite Field of size 5
```

```
>>> from sage.all import *
>>> K.center(name='y') #_
→needs sage.rings.finite_rings
Fraction Field of Univariate Polynomial Ring in y over Finite Field of size 5
```

or use the bracket notation:

```
sage: Zy.<y> = K.center(); Zy #_
→needs sage.rings.finite_rings
Fraction Field of Univariate Polynomial Ring in y over Finite Field of size 5
```

```
>>> from sage.all import *
>>> Zy = K.center(names='y,); (y,) = Zy._first_ngens(1); Zy #_
→ # needs sage.rings.finite_rings
Fraction Field of Univariate Polynomial Ring in y over Finite Field of size 5
```

A coercion map from the center to the Ore function field is set:

```
sage: K.has_coerce_map_from(Zy) #_
→needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> K.has_coerce_map_from(Zy) #_
→needs sage.rings.finite_rings
True
```

and pushout works:

```
sage: # needs sage.rings.finite_rings
sage: x.parent()
Ore Polynomial Ring in x over Finite Field in t of size 5^3 twisted by t |-->_
˓→t^5
sage: y.parent()
Fraction Field of Univariate Polynomial Ring in y over Finite Field of size 5
sage: P = x + y; P
x^3 + x
sage: P.parent()
Ore Function Field in x over Finite Field in t of size 5^3 twisted by t |-->_
˓→t^5
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> x.parent()
Ore Polynomial Ring in x over Finite Field in t of size 5^3 twisted by t |-->_
˓→t^5
>>> y.parent()
Fraction Field of Univariate Polynomial Ring in y over Finite Field of size 5
>>> P = x + y; P
x^3 + x
>>> P.parent()
Ore Function Field in x over Finite Field in t of size 5^3 twisted by t |-->_
˓→t^5
```

A conversion map in the reverse direction is also set:

```
sage: # needs sage.rings.finite_rings
sage: Zy(x^(-6) + 2)
(2*y^2 + 1)/y^2
sage: Zy(1/x^2)
Traceback (most recent call last):
...
ValueError: x^(-2) is not in the center
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> Zy(x**(-Integer(6)) + Integer(2))
(2*y^2 + 1)/y^2
>>> Zy(Integer(1)/x**Integer(2))
Traceback (most recent call last):

ValueError: x^(-2) is not in the center
```

#### ABOUT THE DEFAULT NAME OF THE CENTRAL VARIABLE:

A priori, the default is  $z$ .

However, a variable name is given the first time this method is called, the given name become the default for the next calls:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(11^3)
```

(continues on next page)

(continued from previous page)

```
sage: phi = k.frobenius_endomorphism()
sage: S.<X> = k['X', phi]
sage: K = S.fraction_field()
sage: C.<u> = K.center() # first call
sage: C
Fraction Field of Univariate Polynomial Ring in u over Finite Field of size 11
sage: K.center() # second call: the variable name is still u
Fraction Field of Univariate Polynomial Ring in u over Finite Field of size 11
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(11)**Integer(3), names=('t',)); (t,) = k._first_ngens(1)
>>> phi = k.frobenius_endomorphism()
>>> S = k['X', phi]; (X,) = S._first_ngens(1)
>>> K = S.fraction_field()
>>> C = K.center(names=('u',)); (u,) = C._first_ngens(1) # first call
>>> C
Fraction Field of Univariate Polynomial Ring in u over Finite Field of size 11
>>> K.center() # second call: the variable name is still u
Fraction Field of Univariate Polynomial Ring in u over Finite Field of size 11
```

We can update the default variable name by passing in the argument `default=True`:

```
sage: # needs sage.rings.finite_rings
sage: D.<v> = K.center(default=True)
sage: D
Fraction Field of Univariate Polynomial Ring in v over Finite Field of size 11
sage: K.center()
Fraction Field of Univariate Polynomial Ring in v over Finite Field of size 11
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> D = K.center(default=True, names=('v',)); (v,) = D._first_ngens(1)
>>> D
Fraction Field of Univariate Polynomial Ring in v over Finite Field of size 11
>>> K.center()
Fraction Field of Univariate Polynomial Ring in v over Finite Field of size 11
```

`class sage.rings.polynomial.ore_function_field.SectionOreFunctionCenterInjection(embed)`

Bases: `Section`

Section of the canonical injection of the center of a Ore function field into this field

## 1.8 Fraction field elements of Ore polynomial rings

AUTHOR:

- Xavier Caruso (2020-05)

`class sage.rings.polynomial.ore_function_element.ConstantOreFunctionSection`

Bases: `Map`

Representation of the canonical homomorphism from the constants of a Ore function field to the base field.

This class is needed by the coercion system.

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: from sage.rings.polynomial.ore_polynomial_element import_
    ConstantOrePolynomialSection
sage: k.<a> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: K = S.fraction_field()
sage: iota = K.coerce_map_from(k)
sage: sigma = iota.section(); sigma
Generic map:
From: Ore Function Field in x over Finite Field in a of size 5^3
      twisted by a |--> a^5
To:   Finite Field in a of size 5^3
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> from sage.rings.polynomial.ore_polynomial_element import_
    ConstantOrePolynomialSection
>>> k = GF(Integer(5)**Integer(3), names=('a',)); (a,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> K = S.fraction_field()
>>> iota = K.coerce_map_from(k)
>>> sigma = iota.section(); sigma
Generic map:
From: Ore Function Field in x over Finite Field in a of size 5^3
      twisted by a |--> a^5
To:   Finite Field in a of size 5^3
```

```
class sage.rings.polynomial.ore_function_element.OreFunction(parent, numerator,
                                                               denominator=None,
                                                               simplify=True)
```

Bases: `AlgebraElement`

An element in a Ore function field.

`hilbert_shift(s, var=None)`

Return this Ore function with variable shifted by  $s$ , i.e. if this Ore function is  $f(x)$ , return  $f(x + s)$ .

INPUT:

- $s$  – an element in the base ring
- $\text{var}$  – string; the variable name

EXAMPLES:

```
sage: R.<t> = GF(7) []
sage: der = R.derivation()
sage: A.<d> = R['d', der]
sage: K = A.fraction_field()
```

(continues on next page)

(continued from previous page)

```
sage: f = 1 / (d-t)
sage: f.hilbert_shift(t)
d^(-1)
```

```
>>> from sage.all import *
>>> R = GF(Integer(7))['t']; (t,) = R._first_ngens(1)
>>> der = R.derivation()
>>> A = R['d', der]; (d,) = A._first_ngens(1)
>>> K = A.fraction_field()

>>> f = Integer(1) / (d-t)
>>> f.hilbert_shift(t)
d^(-1)
```

One can specify another variable name:

```
sage: f.hilbert_shift(t, var='x')
x^(-1)
```

```
>>> from sage.all import *
>>> f.hilbert_shift(t, var='x')
x^(-1)
```

When the twisting morphism is not trivial, the output lies in a different Ore polynomial ring:

```
sage: # needs sage.rings.finite_rings
sage: k.<a> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: K = S.fraction_field()
sage: f = (x-a)^(-2)
sage: g = f.hilbert_shift(a); g
x^(-2)
sage: g.parent()
Ore Function Field in x over Finite Field in a of size 5^3
twisted by a |--> a^5 and a*([a |--> a^5] - id)
sage: g.parent() is S
False
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=('a',)); (a,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> K = S.fraction_field()
>>> f = (x-a)**(-Integer(2))
>>> g = f.hilbert_shift(a); g
x^(-2)
>>> g.parent()
Ore Function Field in x over Finite Field in a of size 5^3
twisted by a |--> a^5 and a*([a |--> a^5] - id)
```

(continues on next page)

(continued from previous page)

```
>>> g.parent() is S
False
```

This behavior ensures that the Hilbert shift by a fixed element defines a homomorphism of fields:

```
sage: # needs sage.rings.finite_rings
sage: U = K.random_element(degree=5)
sage: V = K.random_element(degree=5)
sage: s = k.random_element()
sage: (U+V).hilbert_shift(s) == U.hilbert_shift(s) + V.hilbert_shift(s)
True
sage: (U*V).hilbert_shift(s) == U.hilbert_shift(s) * V.hilbert_shift(s)
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> U = K.random_element(degree=Integer(5))
>>> V = K.random_element(degree=Integer(5))
>>> s = k.random_element()
>>> (U+V).hilbert_shift(s) == U.hilbert_shift(s) + V.hilbert_shift(s)
True
>>> (U*V).hilbert_shift(s) == U.hilbert_shift(s) * V.hilbert_shift(s)
True
```

### `is_zero()`

Return `True` if this element is equal to zero.

#### EXAMPLES:

```
sage: R.<t> = GF(3) []
sage: der = R.derivation()
sage: A.<d> = R['x', der]
sage: f = t/d
sage: f.is_zero()
False
sage: (f-f).is_zero()
True
```

```
>>> from sage.all import *
>>> R = GF(Integer(3))['t']; (t,) = R._first_ngens(1)
>>> der = R.derivation()
>>> A = R['x', der]; (d,) = A._first_ngens(1)
>>> f = t/d
>>> f.is_zero()
False
>>> (f-f).is_zero()
True
```

### `left_denominator()`

Return  $s$  if this element reads  $s^{-1}t$ .

WARNING:

When the twisting morphism is bijective, there is a unique irreducible fraction of the form  $s^{-1}t$  representing this element. Here irreducible means that  $s$  and  $t$  have no nontrivial common left divisor. Under this additional assumption, this method always returns this distinguished denominator  $s$ .

On the contrary, when the twisting morphism is not bijective, this method returns the denominator of *some* fraction representing the input element. However, the software guarantees that the method `right_numerator()` outputs the numerator of the *same* fraction.

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<a> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: s = x + a
sage: t = x^2 + a*x + a^2
sage: f = s^(-1) * t
sage: f.left_denominator()
x + a
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='a,); (a,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> s = x + a
>>> t = x**Integer(2) + a*x + a**Integer(2)
>>> f = s**(-Integer(1)) * t
>>> f.left_denominator()
x + a
```

In the example below, a simplification occurs:

```
sage: # needs sage.rings.finite_rings
sage: u = S.random_element(degree=2)
sage: g = (u*s)^(-1) * (u*t)
sage: g.left_denominator()
x + a
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> u = S.random_element(degree=Integer(2))
>>> g = (u*s)**(-Integer(1)) * (u*t)
>>> g.left_denominator()
x + a
```

When the twisting morphism is not invertible, simplifications do not occur in general:

```
sage: R.<z> = GF(11) []
sage: sigma = R.hom([z^2])
sage: S.<x> = R['x', sigma]
sage: s = (x + z)^2
sage: t = (x + z) * (x^2 + z^2)
sage: f = s^(-1) * t
```

#

(continues on next page)

(continued from previous page)

```

↪needs sage.rings.function_field
sage: f.left_denominator() #_
↪needs sage.rings.function_field
x^2 + (z^2 + z)*x + z^2

```

```

>>> from sage.all import *
>>> R = GF(Integer(11))['z']; (z,) = R._first_ngens(1)
>>> sigma = R.hom([z**Integer(2)])
>>> S = R['x', sigma]; (x,) = S._first_ngens(1)
>>> s = (x + z)**Integer(2)
>>> t = (x + z) * (x**Integer(2) + z**Integer(2))
>>> f = s**(-Integer(1)) * t
↪      # needs sage.rings.function_field
>>> f.left_denominator() #_
↪needs sage.rings.function_field
x^2 + (z^2 + z)*x + z^2

```

However, the following always holds true:

```

sage: f == f.left_denominator()^(-1) * f.right_numerator() #_
↪needs sage.rings.function_field
True

```

```

>>> from sage.all import *
>>> f == f.left_denominator()**(-Integer(1)) * f.right_numerator() #_
↪      # needs sage.rings.function_field
True

```

### See also

`right_numerator()`, `left_numerator()`, `right_denominator()`

#### `left_numerator()`

Return  $t$  if this element reads  $ts^{-1}$ .

#### WARNING:

When the twisting morphism is bijective, there is a unique irreducible fraction of the form  $ts^{-1}$  representing this element. Here irreducible means that  $s$  and  $t$  have no nontrivial common right divisor. Under this additional assumption, this method always returns this distinguished numerator  $t$ .

On the contrary, when the twisting morphism is not bijective, the existence of the writing  $ts^{-1}$  is not guaranteed in general. In this case, this method raises an error.

#### EXAMPLES:

```

sage: # needs sage.rings.finite_rings
sage: k.<a> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: s = x + a
sage: t = x^2 + a*x + a^2

```

(continues on next page)

(continued from previous page)

```
sage: f = t/s
sage: f.left_numerator()
x^2 + a*x + a^2
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='a'); (a,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> s = x + a
>>> t = x**Integer(2) + a*x + a**Integer(2)
>>> f = t/s
>>> f.left_numerator()
x^2 + a*x + a^2
```

In the example below, a simplification occurs:

```
sage: # needs sage.rings.finite_rings
sage: u = S.random_element(degree=2)
sage: g = (t*u) / (s*u)
sage: g.left_numerator()
x^2 + a*x + a^2
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> u = S.random_element(degree=Integer(2))
>>> g = (t*u) / (s*u)
>>> g.left_numerator()
x^2 + a*x + a^2
```

#### `right_denominator()`

Return  $s$  if this element reads  $ts^{-1}$ .

#### WARNING:

When the twisting morphism is bijective, there is a unique irreducible fraction of the form  $ts^{-1}$  representing this element. Here irreducible means that  $s$  and  $t$  have no nontrivial common right divisor. Under this additional assumption, this method always returns this distinguished denominator  $s$ .

On the contrary, when the twisting morphism is not bijective, the existence of the writing  $ts^{-1}$  is not guaranteed in general. In this case, this method raises an error.

#### EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<a> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: s = x + a
sage: t = x^2 + a*x + a^2
sage: f = t/s
sage: f.right_denominator()
x + a
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='a'); (a,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> s = x + a
>>> t = x**Integer(2) + a*x + a**Integer(2)
>>> f = t/s
>>> f.right_denominator()
x + a
```

In the example below, a simplification occurs:

```
sage: # needs sage.rings.finite_rings
sage: u = S.random_element(degree=2)
sage: g = (t*u) / (s*u)
sage: g.right_denominator()
x + a
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> u = S.random_element(degree=Integer(2))
>>> g = (t*u) / (s*u)
>>> g.right_denominator()
x + a
```

x^2 + a*x + a^2
```

In the example below, a simplification occurs:

```
sage: # needs sage.rings.finite_rings
sage: u = S.random_element(degree=2)
sage: g = (u*s)^(-1) * (u*t)
sage: g.right_numerator()
x^2 + a*x + a^2
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> u = S.random_element(degree=Integer(2))
>>> g = (u*s)**(-Integer(1)) * (u*t)
>>> g.right_numerator()
x^2 + a*x + a^2
```

### See also

`left_denominator()`, `left_numerator()`, `right_denominator()`

**class** sage.rings.polynomial.ore\_function\_element.**OreFunctionBaseringInjection**(*domain, codomain*)

Bases: `Morphism`

Representation of the canonical homomorphism from a field  $k$  into a Ore function field over  $k$ .

This class is needed by the coercion system.

`an_element()`

Return an element of the codomain of the ring homomorphism.

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x',Frob]
sage: K = S.fraction_field()
sage: m = K.coerce_map_from(k)
sage: m.an_element()
x
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=(t,),); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x',Frob]; (x,) = S._first_ngens(1)
>>> K = S.fraction_field()
>>> m = K.coerce_map_from(k)
>>> m.an_element()
x
```

**section()**

Return the canonical homomorphism from the constants of a Ore function field to its base field.

```
class sage.rings.polynomial.ore_function_element.OreFunction_with_large_center(parent, numerator, denominator=None, simplify=True)
```

Bases: *OreFunction*

A special class for elements of Ore function fields whose center has finite index.

**reduced\_norm(var=None)**

Return the reduced norm of this Ore function.

INPUT:

- var – string or None (default: None); the name of the central variable

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: K = S.fraction_field()
sage: a = (x + t) / (x^2 + t^2)
sage: N = a.reduced_norm(); N
(z + 2)/(z^2 + 4)
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names=(t,),); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> K = S.fraction_field()
>>> a = (x + t) / (x**Integer(2) + t**Integer(2))
>>> N = a.reduced_norm(); N
(z + 2)/(z^2 + 4)
```

The reduced norm lies in the center of  $S$ , which is the fraction field of a univariate polynomial ring in the variable  $z = x^3$  over  $GF(5)$ .

```
sage: # needs sage.rings.finite_rings
sage: N.parent()
Fraction Field of Univariate Polynomial Ring in z over Finite Field of size 5
sage: N.parent() is K.center()
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> N.parent()
Fraction Field of Univariate Polynomial Ring in z over Finite Field of size 5
>>> N.parent() is K.center()
True
```

We can use explicit conversion to view  $N$  as a skew polynomial:

```
sage: K(N)
# needs sage.rings.finite_rings
(x^6 + 4)^(-1) * (x^3 + 2)
```

```
>>> from sage.all import *
>>> K(N)
# needs sage.rings.finite_rings
(x^6 + 4)^(-1) * (x^3 + 2)
```

By default, the name of the central variable is usually  $z$  (see `sage.rings.polynomial.skew_polynomial_ring.SkewPolynomialRing_finite_order.center()` for more details about this). However, the user can specify a different variable name if desired:

```
sage: a.reduced_norm(var='u')
# needs sage.rings.finite_rings
(u + 2) / (u^2 + 4)
```

```
>>> from sage.all import *
>>> a.reduced_norm(var='u')
# needs sage.rings.finite_rings
(u + 2) / (u^2 + 4)
```

**reduced\_trace(var=None)**

Return the reduced trace of this element.

INPUT:

- `var` – string or `None` (default: `None`); the name of the central variable

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: k.<t> = GF(5^3)
sage: Frob = k.frobenius_endomorphism()
sage: S.<x> = k['x', Frob]
sage: K = S.fraction_field()
sage: a = 1 / (x^2 + t)
sage: tr = a.reduced_trace(); tr
3/(z^2 + 2)
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> k = GF(Integer(5)**Integer(3), names='t',); (t,) = k._first_ngens(1)
>>> Frob = k.frobenius_endomorphism()
>>> S = k['x', Frob]; (x,) = S._first_ngens(1)
>>> K = S.fraction_field()
>>> a = Integer(1) / (x**Integer(2) + t)
>>> tr = a.reduced_trace(); tr
3/(z^2 + 2)
```

The reduced trace lies in the center of  $S$ , which is the fraction field of a univariate polynomial ring in the variable  $z = x^3$  over  $GF(5)$ :

```
sage: # needs sage.rings.finite_rings
sage: tr.parent()
Fraction Field of Univariate Polynomial Ring in z over Finite Field of size 5
sage: tr.parent() is K.center()
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> tr.parent()
Fraction Field of Univariate Polynomial Ring in z over Finite Field of size 5
>>> tr.parent() is K.center()
True
```

We can use explicit conversion to view  $tr$  as a Ore function:

```
sage: K(tr) #_
→needs sage.rings.finite_rings
(x^6 + 2)^(-1) * 3
```

```
>>> from sage.all import *
>>> K(tr) #_
→needs sage.rings.finite_rings
(x^6 + 2)^(-1) * 3
```

By default, the name of the central variable is usually  $z$  (see `sage.rings.polynomial.skew_polynomial_ring.OreFunctionField_with_large_center.center()` for more details about this). However, the user can specify a different variable name if desired:

```
sage: a.reduced_trace(var='u') #_
→needs sage.rings.finite_rings
3/(u^2 + 2)
```

```
>>> from sage.all import *
>>> a.reduced_trace(var='u') #_
→needs sage.rings.finite_rings
3/(u^2 + 2)
```

## NONCOMMUTATIVE MULTIVARIATE POLYNOMIALS

### 2.1 Noncommutative polynomials via libSINGULAR/Plural

This module provides specialized and optimized implementations for noncommutative multivariate polynomials over many coefficient rings, via the shared library interface to SINGULAR. In particular, the following coefficient rings are supported by this implementation:

- the rational numbers  $\mathbf{Q}$ , and
- finite fields  $\mathbf{F}_p$  for  $p$  prime

#### AUTHORS:

The PLURAL wrapper is due to

- Burcin Erocal (2008-11 and 2010-07): initial implementation and concept
- Michael Brickenstein (2008-11 and 2010-07): initial implementation and concept
- Oleksandr Motsak (2010-07): complete overall noncommutative functionality and first release
- Alexander Dreyer (2010-07): noncommutative ring functionality and documentation
- Simon King (2011-09): left and two-sided ideals; normal forms; pickling; documentation

The underlying libSINGULAR interface was implemented by

- Martin Albrecht (2007-01): initial implementation
- Joel Mohler (2008-01): misc improvements, polishing
- Martin Albrecht (2008-08): added  $\mathbf{Q}(a)$  and  $\mathbf{Z}$  support
- Simon King (2009-04): improved coercion
- Martin Albrecht (2009-05): added  $\mathbf{Z}/n\mathbf{Z}$  support, refactoring
- Martin Albrecht (2009-06): refactored the code to allow better re-use

#### Todo

extend functionality towards those of libSINGULAR's commutative part

#### EXAMPLES:

We show how to construct various noncommutative polynomial rings:

```
sage: A.<x,y,z> = FreeAlgebra(QQ, 3)
sage: P.<x,y,z> = A.g_algebra(relations={y*x:-x*y}, order = 'lex')

sage: P
Noncommutative Multivariate Polynomial Ring in x, y, z over Rational Field, nc-
relations: {y*x: -x*y}

sage: y*x + 1/2
-x*y + 1/2

sage: A.<x,y,z> = FreeAlgebra(GF(17), 3)
sage: P.<x,y,z> = A.g_algebra(relations={y*x:-x*y}, order = 'lex')
sage: P
Noncommutative Multivariate Polynomial Ring in x, y, z over Finite Field of size 17, nc-
relations: {y*x: -x*y}

sage: y*x + 7
-x*y + 7
```

```
>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'y', 'z',)); (x, y, z,) = A._first_
    <ngens(3)
>>> P = A.g_algebra(relations={y*x:-x*y}, order = 'lex', names=('x', 'y', 'z',)); (x, y, z,) = P._first_ngens(3)

>>> P
Noncommutative Multivariate Polynomial Ring in x, y, z over Rational Field, nc-
relations: {y*x: -x*y}

>>> y*x + Integer(1)/Integer(2)
-x*y + 1/2

>>> A = FreeAlgebra(GF(Integer(17)), Integer(3), names=('x', 'y', 'z',)); (x, y, z,) =
    <= A._first_ngens(3)
>>> P = A.g_algebra(relations={y*x:-x*y}, order = 'lex', names=('x', 'y', 'z',)); (x, y, z,) = P._first_ngens(3)
>>> P
Noncommutative Multivariate Polynomial Ring in x, y, z over Finite Field of size 17, nc-
relations: {y*x: -x*y}

>>> y*x + Integer(7)
-x*y + 7
```

Raw use of this class; *this is not the intended use!*

```
sage: from sage.matrix.constructor import Matrix
sage: c = Matrix(3)
sage: c[0,1] = -2
sage: c[0,2] = 1
sage: c[1,2] = 1

sage: d = Matrix(3)
sage: d[0, 1] = 17
```

(continues on next page)

(continued from previous page)

```

sage: P = QQ['x','y','z']
sage: c = c.change_ring(P)
sage: d = d.change_ring(P)

sage: from sage.rings.polynomial.plural import NCPolynomialRing_plural
sage: R.<x,y,z> = NCPolynomialRing_plural(QQ, c = c, d = d, order=TermOrder('lex',3),
    ↪category=Algebras(QQ))
sage: R
Noncommutative Multivariate Polynomial Ring in x, y, z over Rational Field, nc-
    ↪relations: {y*x: -2*x*y + 17}

sage: R.term_order()
Lexicographic term order

sage: a,b,c = R.gens()
sage: f = 57 * a^2*b + 43 * c + 1; f
57*x^2*y + 43*z + 1

```

```

>>> from sage.all import *
>>> from sage.matrix.constructor import Matrix
>>> c = Matrix(Integer(3))
>>> c[Integer(0), Integer(1)] = -Integer(2)
>>> c[Integer(0), Integer(2)] = Integer(1)
>>> c[Integer(1), Integer(2)] = Integer(1)

>>> d = Matrix(Integer(3))
>>> d[Integer(0), Integer(1)] = Integer(17)
>>> P = QQ['x','y','z']
>>> c = c.change_ring(P)
>>> d = d.change_ring(P)

>>> from sage.rings.polynomial.plural import NCPolynomialRing_plural
>>> R = NCPolynomialRing_plural(QQ, c = c, d = d, order=TermOrder('lex', Integer(3)),
    ↪category=Algebras(QQ), names=('x', 'y', 'z',)); (x, y, z,) = R._first_ngens(3)
>>> R
Noncommutative Multivariate Polynomial Ring in x, y, z over Rational Field, nc-
    ↪relations: {y*x: -2*x*y + 17}

>>> R.term_order()
Lexicographic term order

>>> a,b,c = R.gens()
>>> f = Integer(57) * a**Integer(2)*b + Integer(43) * c + Integer(1); f
57*x^2*y + 43*z + 1

```

`sage.rings.polynomial.plural.ExteriorAlgebra(base_ring, names, order='degrelex')`

Return the exterior algebra on some generators.

This is also known as a Grassmann algebra. This is a finite dimensional algebra, where all generators anti-commute.

See [Wikipedia article Exterior algebra](#)

INPUT:

- `base_ring` – the ground ring
- `names` – list of variable names

EXAMPLES:

```
sage: from sage.rings.polynomial.plural import ExteriorAlgebra
sage: E = ExteriorAlgebra(QQ, ['x', 'y', 'z']); E #random
Quotient of Noncommutative Multivariate Polynomial Ring in x, y, z over Rational
Field, nc-relations: {z*x: -x*z, z*y: -y*z, y*x: -x*y} by the ideal (z^2, y^2,
x^2)
sage: sorted(E.cover().domain().relations().items(), key=str)
[(y*x, -x*y), (z*x, -x*z), (z*y, -y*z)]
sage: sorted(E.cover().kernel().gens(), key=str)
[x^2, y^2, z^2]
sage: E.inject_variables()
Defining xbar, ybar, zbar
sage: x,y,z = (xbar,ybar,zbar)
sage: y*x
-x*y
sage: all(v^2==0 for v in E.gens())
True
sage: E.one()
1
```

```
>>> from sage.all import *
>>> from sage.rings.polynomial.plural import ExteriorAlgebra
>>> E = ExteriorAlgebra(QQ, ['x', 'y', 'z']); E #random
Quotient of Noncommutative Multivariate Polynomial Ring in x, y, z over Rational
Field, nc-relations: {z*x: -x*z, z*y: -y*z, y*x: -x*y} by the ideal (z^2, y^2,
x^2)
>>> sorted(E.cover().domain().relations().items(), key=str)
[(y*x, -x*y), (z*x, -x*z), (z*y, -y*z)]
>>> sorted(E.cover().kernel().gens(), key=str)
[x^2, y^2, z^2]
>>> E.inject_variables()
Defining xbar, ybar, zbar
>>> x,y,z = (xbar,ybar,zbar)
>>> y*x
-x*y
>>> all(v**Integer(2)==Integer(0) for v in E.gens())
True
>>> E.one()
1
```

```
class sage.rings.polynomial.ExteriorAlgebra_plural
Bases: NCPolynomialRing_plural

class sage.rings.polynomial.G_AlgFactory
Bases: UniqueFactory

A factory for the creation of g-algebras as unique parents.

create_key_and_extra_args(base_ring, c, d, names=None, order=None, category=None, check=None,
                           commutative=None)

Create a unique key for g-algebras.
```

## INPUT:

- `base_ring` – a ring
- `c, d` – two matrices
- `names` – tuple or list of names
- `order` – (optional) term order
- `category` – (optional) category
- `check` – (optional) boolean
- `commutative` – (optional) boolean

`create_object`(*version*, *key*, \*\**extra\_args*)

Create a g-algebra to a given unique key.

## INPUT:

- `key` – a 6-tuple, formed by a base ring, a tuple of names, two matrices over a polynomial ring over the base ring with the given variable names, a term order, and a category
- `extra_args` – dictionary, whose only relevant key is ‘check’

`class sage.rings.polynomial.plural.NCPolynomialRing_plural`Bases: `Ring`

A non-commutative polynomial ring.

## EXAMPLES:

```
sage: A.<x,y,z> = FreeAlgebra(QQ, 3)
sage: H = A.g_algebra({y*x:x*y-z, z*x:x*z+2*x, z*y:y*z-2*y})
sage: H._is_category_initialized()
True
sage: H.category()
Category of algebras over Rational Field
sage: TestSuite(H).run()
```

```
>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'y', 'z',)); (x, y, z,) = A._
... first_ngens(3)
>>> H = A.g_algebra({y*x:x*y-z, z*x:x*z+Integer(2)*x, z*y:y*z-Integer(2)*y})
>>> H._is_category_initialized()
True
>>> H.category()
Category of algebras over Rational Field
>>> TestSuite(H).run()
```

Note that two variables commute if they are not part of the given relations:

```
sage: H.<x,y,z> = A.g_algebra({z*x:x*z+2*x, z*y:y*z-2*y})
sage: x*y == y*x
True
```

```
>>> from sage.all import *
>>> H = A.g_algebra({z*x:x*z+Integer(2)*x, z*y:y*z-Integer(2)*y}, names=('x', 'y',
... (continues on next page)
```

(continued from previous page)

```

↪ 'z'); (x, y, z) = H._first_ngens(3)
>>> x*y == y*x
True

```

**algebra\_generators()**

Return the algebra generators of self.

EXAMPLES:

```

sage: A.<x,y,z> = FreeAlgebra(QQ, 3)
sage: P = A.g_algebra(relations={y*x:-x*y}, order='lex')
sage: P.algebra_generators()
Finite family {'x': x, 'y': y, 'z': z}

```

```

>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'y', 'z',)); (x, y, z,) = A._
↪first_ngens(3)
>>> P = A.g_algebra(relations={y*x:-x*y}, order='lex')
>>> P.algebra_generators()
Finite family {'x': x, 'y': y, 'z': z}

```

**free\_algebra()**

Return the free algebra of which this is the quotient.

EXAMPLES:

```

sage: A.<x,y,z> = FreeAlgebra(QQ, 3)
sage: P = A.g_algebra(relations={y*x:-x*y}, order = 'lex')
sage: B = P.free_algebra()
sage: A == B
True

```

```

>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'y', 'z',)); (x, y, z,) = A._
↪first_ngens(3)
>>> P = A.g_algebra(relations={y*x:-x*y}, order = 'lex')
>>> B = P.free_algebra()
>>> A == B
True

```

**gen( $n=0$ )**

Return the n-th generator of this noncommutative polynomial ring.

INPUT:

- n – nonnegative integer

EXAMPLES:

```

sage: A.<x,y,z> = FreeAlgebra(QQ, 3)
sage: P = A.g_algebra(relations={y*x:-x*y}, order = 'lex')
sage: P.gen(), P.gen(1)
(x, y)

```

```
>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'y', 'z',)); (x, y, z,) = A._
↪first_ngens(3)
>>> P = A.g_algebra(relations={y*x:-x*y}, order = 'lex')
>>> P.gen(),P.gen(Integer(1))
(x, y)
```

Note that the generators are not cached:

```
sage: P.gen(1) is P.gen(1)
False
```

```
>>> from sage.all import *
>>> P.gen(Integer(1)) is P.gen(Integer(1))
False
```

**ideal(\*gens, \*\*kwd)**

Create an ideal in this polynomial ring.

INPUT:

- \*gens – list or tuple of generators (or several input arguments)
- coerce – boolean (default: `True`); this must be a keyword argument. Only set it to `False` if you are certain that each generator is already in the ring.
- side – string (either “left”, which is the default, or “twosided”) Must be a keyword argument. Defines whether the ideal is a left ideal or a two-sided ideal. Right ideals are not implemented.

EXAMPLES:

```
sage: A.<x,y,z> = FreeAlgebra(QQ, 3)
sage: P.<x,y,z> = A.g_algebra(relations={y*x:-x*y}, order = 'lex')

sage: P.ideal([x + 2*y + 2*z-1, 2*x*y + 2*y*z-y, x^2 + 2*y^2 + 2*z^2-x])
Left Ideal (x + 2*y + 2*z - 1, 2*x*y + 2*y*z - y, x^2 - x + 2*y^2 + 2*z^2) of
↪Noncommutative Multivariate Polynomial Ring in x, y, z over Rational Field,
↪nc-relations: {y*x: -x*y}
sage: P.ideal([x + 2*y + 2*z-1, 2*x*y + 2*y*z-y, x^2 + 2*y^2 + 2*z^2-x], side=
↪'twosided')
Twosided Ideal (x + 2*y + 2*z - 1, 2*x*y + 2*y*z - y, x^2 - x + 2*y^2 + 2*z^2)
↪ of Noncommutative Multivariate Polynomial Ring in x, y, z over Rational
↪Field, nc-relations: {y*x: -x*y}
```

```
>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'y', 'z',)); (x, y, z,) = A._
↪first_ngens(3)
>>> P = A.g_algebra(relations={y*x:-x*y}, order = 'lex', names=('x', 'y', 'z',
↪)); (x, y, z,) = P._first_ngens(3)

>>> P.ideal([x + Integer(2)*y + Integer(2)*z-Integer(1), Integer(2)*x*y +
↪Integer(2)*y*z-y, x**Integer(2) + Integer(2)*y**Integer(2) +
↪Integer(2)*z**Integer(2)-x])
Left Ideal (x + 2*y + 2*z - 1, 2*x*y + 2*y*z - y, x^2 - x + 2*y^2 + 2*z^2) of
↪Noncommutative Multivariate Polynomial Ring in x, y, z over Rational Field,
```

(continues on next page)

(continued from previous page)

```

↳nc-relations: {y*x: -x*y}
>>> P.ideal([x + Integer(2)*y + Integer(2)*z-Integer(1), Integer(2)*x*y +_
↳Integer(2)*y*z-y, x**Integer(2) + Integer(2)*y**Integer(2) +_
↳Integer(2)*z**Integer(2)-x], side='twosided')
Twosided Ideal (x + 2*y + 2*z - 1, 2*x*y + 2*y*z - y, x^2 - x + 2*y^2 + 2*z^_
→2) of Noncommutative Multivariate Polynomial Ring in x, y, z over Rational_
→Field, nc-relations: {y*x: -x*y}

```

**is\_field(\*args, \*\*kwargs)**

Return False.

EXAMPLES:

```

sage: A.<x,y,z> = FreeAlgebra(QQ, 3)
sage: P = A.g_algebra(relations={y*x:-x*y}, order = 'lex')
sage: P.is_field()
False

```

```

>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'y', 'z',)); (x, y, z,) = A._
↳first_ngens(3)
>>> P = A.g_algebra(relations={y*x:-x*y}, order = 'lex')
>>> P.is_field()
False

```

**monomial\_all\_divisors(t)**

Return a list of all monomials that divide t.

Coefficients are ignored.

INPUT:

- t – a monomial

OUTPUT: list of monomials

EXAMPLES:

```

sage: A.<x,y,z> = FreeAlgebra(QQ, 3)
sage: P = A.g_algebra(relations={y*x:-x*y}, order='lex')
sage: P.inject_variables()
Defining x, y, z

sage: P.monomial_all_divisors(x^2*z^3)
[x, x^2, z, x*z, x^2*z, z^2, x*z^2, x^2*z^2, z^3, x*z^3, x^2*z^3]

```

```

>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'y', 'z',)); (x, y, z,) = A._
↳first_ngens(3)
>>> P = A.g_algebra(relations={y*x:-x*y}, order='lex')
>>> P.inject_variables()
Defining x, y, z

>>> P.monomial_all_divisors(x**Integer(2)*z**Integer(3))
[x, x^2, z, x*z, x^2*z, z^2, x*z^2, x^2*z^2, z^3, x*z^3, x^2*z^3]

```

ALGORITHM: addwithcarry idea by Toon Segers

**monomial\_divides**(*a*, *b*)

Return `False` if *a* does not divide *b* and `True` otherwise.

Coefficients are ignored.

INPUT:

- *a* – monomial
- *b* – monomial

EXAMPLES:

```
sage: A.<x,y,z> = FreeAlgebra(QQ, 3)
sage: P = A.g_algebra(relations={y*x:-x*y}, order='lex')
sage: P.inject_variables()
Defining x, y, z

sage: P.monomial_divides(x*y*z, x^3*y^2*z^4)
True
sage: P.monomial_divides(x^3*y^2*z^4, x*y*z)
False
```

```
>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'y', 'z',)); (x, y, z,) = A._
    ↪first_ngens(3)
>>> P = A.g_algebra(relations={y*x:-x*y}, order='lex')
>>> P.inject_variables()
Defining x, y, z

>>> P.monomial_divides(x*y*z, x**Integer(3)*y**Integer(2)*z**Integer(4))
True
>>> P.monomial_divides(x**Integer(3)*y**Integer(2)*z**Integer(4), x*y*z)
False
```

**monomial\_lcm**(*f*, *g*)

LCM for monomials. Coefficients are ignored.

INPUT:

- *f* – monomial
- *g* – monomial

EXAMPLES:

```
sage: A.<x,y,z> = FreeAlgebra(QQ, 3)
sage: P = A.g_algebra(relations={y*x:-x*y}, order='lex')
sage: P.inject_variables()
Defining x, y, z

sage: P.monomial_lcm(3/2*x*y,x)
x*y
```

```
>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'y', 'z',)); (x, y, z,) = A._
    ↪first_ngens(3)
>>> P = A.g_algebra(relations={y*x:-x*y}, order='lex')
>>> P.inject_variables()
Defining x, y, z

>>> P.monomial_lcm(Integer(3)/Integer(2)*x*y, x)
x*y
```

**monomial\_pairwise\_prime**(*g, h*)

Return True if *h* and *g* are pairwise prime.

Both *h* and *g* are treated as monomials.

Coefficients are ignored.

INPUT:

- *h* – monomial
- *g* – monomial

EXAMPLES:

```
sage: A.<x,y,z> = FreeAlgebra(QQ, 3)
sage: P = A.g_algebra(relations={y*x:-x*y}, order='lex')
sage: P.inject_variables()
Defining x, y, z

sage: P.monomial_pairwise_prime(x^2*z^3, y^4)
True

sage: P.monomial_pairwise_prime(1/2*x^3*y^2, 3/4*y^3)
False
```

```
>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'y', 'z',)); (x, y, z,) = A._
    ↪first_ngens(3)
>>> P = A.g_algebra(relations={y*x:-x*y}, order='lex')
>>> P.inject_variables()
Defining x, y, z

>>> P.monomial_pairwise_prime(x**Integer(2)*z**Integer(3), y**Integer(4))
True

>>> P.monomial_pairwise_prime(Integer(1) /
    ↪Integer(2)*x**Integer(3)*y**Integer(2), Integer(3)/Integer(4)*y**Integer(3))
False
```

**monomial\_quotient**(*f, g, coeff=False*)

Return *f/g*, where both *f* and *g* are treated as monomials.

Coefficients are ignored by default.

INPUT:

- $f$  – monomial
- $g$  – monomial
- `coeff` – divide coefficients as well (default: `False`)

EXAMPLES:

```
sage: A.<x,y,z> = FreeAlgebra(QQ, 3)
sage: P = A.g_algebra(relations={y*x:-x*y}, order='lex')
sage: P.inject_variables()
Defining x, y, z

sage: P.monomial_quotient(3/2*x*y,x,coeff=True)
3/2*y
```

```
>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'y', 'z',)); (x, y, z,) = A._
...>>> first_ngens(3)
>>> P = A.g_algebra(relations={y*x:-x*y}, order='lex')
>>> P.inject_variables()
Defining x, y, z

>>> P.monomial_quotient(Integer(3)/Integer(2)*x*y,x,coeff=True)
3/2*y
```

Note that **Z** behaves differently if `coeff=True`:

```
sage: P.monomial_quotient(2*x,3*x)
1
sage: P.monomial_quotient(2*x,3*x,coeff=True)
2/3
```

```
>>> from sage.all import *
>>> P.monomial_quotient(Integer(2)*x,Integer(3)*x)
1
>>> P.monomial_quotient(Integer(2)*x,Integer(3)*x,coeff=True)
2/3
```

### Warning

Assumes that the head term of  $f$  is a multiple of the head term of  $g$  and return the multiplicant  $m$ . If this rule is violated, funny things may happen.

`monomial_reduce(f, G)`

Try to find a  $g$  in  $G$  where  $g.\text{lm}()$  divides  $f$ . If found  $(\text{fl}, g)$  is returned,  $(0, 0)$  otherwise, where  $\text{fl}$  is  $f/g.\text{lm}()$ .

It is assumed that  $G$  is iterable and contains *only* elements in this polynomial ring.

Coefficients are ignored.

INPUT:

- $f$  – monomial

- $G$  – list/set of mpolynomials

EXAMPLES:

```
sage: A.<x,y,z> = FreeAlgebra(QQ, 3)
sage: P = A.g_algebra(relations={y*x:-x*y}, order='lex')
sage: P.inject_variables()
Defining x, y, z

sage: f = x*y^2
sage: G = [ 3/2*x^3 + y^2 + 1/2, 1/4*x*y + 2/7, 1/2 ]
sage: P.monomial_reduce(f,G)
(y, 1/4*x*y + 2/7)
```

```
>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'y', 'z',)); (x, y, z,) = A._
->first_ngens(3)
>>> P = A.g_algebra(relations={y*x:-x*y}, order='lex')
>>> P.inject_variables()
Defining x, y, z

>>> f = x*y**Integer(2)
>>> G = [ Integer(3)/Integer(2)*x**Integer(3) + y**Integer(2) + Integer(1)/
->Integer(2), Integer(1)/Integer(4)*x*y + Integer(2)/Integer(7), Integer(1)/
->Integer(2) ]
>>> P.monomial_reduce(f,G)
(y, 1/4*x*y + 2/7)
```

### **ngens()**

Return the number of variables in this noncommutative polynomial ring.

EXAMPLES:

```
sage: A.<x,y,z> = FreeAlgebra(QQ, 3)
sage: P.<x,y,z> = A.g_algebra(relations={y*x:-x*y}, order = 'lex')
sage: P.ngens()
3
```

```
>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'y', 'z',)); (x, y, z,) = A._
->first_ngens(3)
>>> P = A.g_algebra(relations={y*x:-x*y}, order = 'lex', names=('x', 'y', 'z',
->)); (x, y, z,) = P._first_ngens(3)
>>> P.ngens()
3
```

### **relations (add\_commutative=False)**

Return the relations of this g-algebra.

INPUT:

- `add_commutative` – boolean (default: False)

OUTPUT:

The defining relations. There are some implicit relations: Two generators commute if they are not part of any given relation. The implicit relations are not provided, unless `add_commutative==True`.

## EXAMPLES:

```
sage: A.<x,y,z> = FreeAlgebra(QQ, 3)
sage: H.<x,y,z> = A.g_algebra({z*x:x*z+2*x, z*y:y*z-2*y})
sage: x*y == y*x
True
sage: H.relations()
{z*x: x*z + 2*x, z*y: y*z - 2*y}
sage: H.relations(add_commutative=True)
{y*x: x*y, z*x: x*z + 2*x, z*y: y*z - 2*y}
```

```
>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'y', 'z',)); (x, y, z,) = A._
    ↪first_ngens(3)
>>> H = A.g_algebra({z*x:x*z+Integer(2)*x, z*y:y*z-Integer(2)*y}, names=('x',
    ↪'y', 'z',)); (x, y, z,) = H._first_ngens(3)
>>> x*y == y*x
True
>>> H.relations()
{z*x: x*z + 2*x, z*y: y*z - 2*y}
>>> H.relations(add_commutative=True)
{y*x: x*y, z*x: x*z + 2*x, z*y: y*z - 2*y}
```

**term\_order()**

Return the term ordering of the noncommutative ring.

## EXAMPLES:

```
sage: A.<x,y,z> = FreeAlgebra(QQ, 3)
sage: P = A.g_algebra(relations={y*x:-x*y}, order = 'lex')
sage: P.term_order()
Lexicographic term order

sage: P = A.g_algebra(relations={y*x:-x*y})
sage: P.term_order()
Degree reverse lexicographic term order
```

```
>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'y', 'z',)); (x, y, z,) = A._
    ↪first_ngens(3)
>>> P = A.g_algebra(relations={y*x:-x*y}, order = 'lex')
>>> P.term_order()
Lexicographic term order

>>> P = A.g_algebra(relations={y*x:-x*y})
>>> P.term_order()
Degree reverse lexicographic term order
```

**class sage.rings.polynomial.plural.NCPolynomial\_plural**

Bases: `RingElement`

A noncommutative multivariate polynomial implemented using libSINGULAR.

**coefficient(degrees)**

Return the coefficient of the variables with the degrees specified in the python dictionary `degrees`.

Mathematically, this is the coefficient in the base ring adjoined by the variables of this ring not listed in degrees. However, the result has the same parent as this polynomial.

This function contrasts with the function `monomial_coefficient()` which returns the coefficient in the base ring of a monomial.

INPUT:

- `degrees` – can be any of: - a dictionary of degree restrictions - a list of degree restrictions (with `None` in the unrestricted variables) - a monomial (very fast, but not as flexible)

OUTPUT: element of the parent of this element

### Note

For coefficients of specific monomials, look at `monomial_coefficient()`.

EXAMPLES:

```
sage: A.<x, z, y> = FreeAlgebra(QQ, 3)
sage: R = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
sage: R.inject_variables()
Defining x, z, y
sage: f=x*y+y+5
sage: f.coefficient({x:0,y:1})
1
sage: f.coefficient({x:0})
y + 5
sage: f=(1+y+y^2)*(1+x+x^2)
sage: f.coefficient({x:0})
z + y^2 + y + 1

sage: f.coefficient(x)
y^2 - y + 1

sage: f.coefficient([0,None]) # not tested
y^2 + y + 1
```

```
>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'z', 'y',)); (x, z, y,) = A._
... first_ngens(3)
>>> R = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
>>> R.inject_variables()
Defining x, z, y
>>> f=x*y+y+Integer(5)
>>> f.coefficient({x:Integer(0),y:Integer(1)})
1
>>> f.coefficient({x:Integer(0)})
y + 5
>>> f=(Integer(1)+y+y**Integer(2))*(Integer(1)+x+x**Integer(2))
>>> f.coefficient({x:Integer(0)})
z + y^2 + y + 1

>>> f.coefficient(x)
```

(continues on next page)

(continued from previous page)

```

y^2 - y + 1

>>> f.coefficient([Integer(0),None]) # not tested
y^2 + y + 1

```

Be aware that this may not be what you think! The physical appearance of the variable  $x$  is deceiving – particularly if the exponent would be a variable.

```

sage: f.coefficient(x^0) # outputs the full polynomial
x^2*y^2 + x^2*y + x^2 + x*y^2 - x*y + x + z + y^2 + y + 1

sage: A.<x,z,y> = FreeAlgebra(GF(389), 3)
sage: R = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
sage: R.inject_variables()
Defining x, z, y
sage: f=x*y+5
sage: c=f.coefficient({x:0,y:0}); c
5
sage: parent(c)
Noncommutative Multivariate Polynomial Ring in x, z, y over Finite Field of
→ size 389, nc-relations: {y*x: -x*y + z}

```

```

>>> from sage.all import *
>>> f.coefficient(x**Integer(0)) # outputs the full polynomial

```

#### AUTHOR:

- Joel B. Mohler (2007-10-31)

#### `constant_coefficient()`

Return the constant coefficient of this multivariate polynomial.

#### EXAMPLES:

```

sage: A.<x,z,y> = FreeAlgebra(GF(389), 3)
sage: P = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
sage: P.inject_variables()
Defining x, z, y
sage: f = 3*x^2 - 2*y + 7*x^2*y^2 + 5
sage: f.constant_coefficient()

```

(continues on next page)

(continued from previous page)

```

5
sage: f = 3*x^2
sage: f.constant_coefficient()
0

```

```

>>> from sage.all import *
>>> A = FreeAlgebra(GF(Integer(389)), Integer(3), names=('x', 'z', 'y',)); (x,
    ↪ z, y,) = A._first_ngens(3)
>>> P = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
>>> P.inject_variables()
Defining x, z, y
>>> f = Integer(3)*x**Integer(2) - Integer(2)*y +
    ↪ Integer(7)*x**Integer(2)*y**Integer(2) + Integer(5)
>>> f.constant_coefficient()
5
>>> f = Integer(3)*x**Integer(2)
>>> f.constant_coefficient()
0

```

**degree (x=None)**

Return the maximal degree of this polynomial in x, where x must be one of the generators for the parent of this polynomial.

INPUT:

- x – multivariate polynomial (a generator of the parent of self) If x is not specified (or is None), return the total degree, which is the maximum degree of any monomial.

OUTPUT: integer

EXAMPLES:

```

sage: A.<x,z,y> = FreeAlgebra(QQ, 3)
sage: R = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
sage: R.inject_variables()
Defining x, z, y
sage: f = y^2 - x^9 - x
sage: f.degree(x)
9
sage: f.degree(y)
2
sage: (y^10*x - 7*x^2*y^5 + 5*x^3).degree(x)
3
sage: (y^10*x - 7*x^2*y^5 + 5*x^3).degree(y)
10

```

```

>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'z', 'y',)); (x, z, y,) = A._
    ↪ first_ngens(3)
>>> R = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
>>> R.inject_variables()
Defining x, z, y
>>> f = y**Integer(2) - x**Integer(9) - x

```

(continues on next page)

(continued from previous page)

```
>>> f.degree(x)
9
>>> f.degree(y)
2
>>> (y**Integer(10)*x - Integer(7)*x**Integer(2)*y**Integer(5) +_
-> Integer(5)*x**Integer(3)).degree(x)
3
>>> (y**Integer(10)*x - Integer(7)*x**Integer(2)*y**Integer(5) +_
-> Integer(5)*x**Integer(3)).degree(y)
10
```

**degrees()**

Return a tuple with the maximal degree of each variable in this polynomial.

The list of degrees is ordered by the order of the generators.

**EXAMPLES:**

```
sage: A.<y0,y1,y2> = FreeAlgebra(QQ, 3)
sage: R = A.g_algebra(relations={y1*y0:-y0*y1 + y2}, order='lex')
sage: R.inject_variables()
Defining y0, y1, y2
sage: q = 3*y0*y1*y2; q
3*y0*y1^2*y2
sage: q.degrees()
(1, 2, 1)
sage: (q + y0^5).degrees()
(5, 2, 1)
```

```
>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('y0', 'y1', 'y2',)); (y0, y1, y2,)_
->= A._first_ngens(3)
>>> R = A.g_algebra(relations={y1*y0:-y0*y1 + y2}, order='lex')
>>> R.inject_variables()
Defining y0, y1, y2
>>> q = Integer(3)*y0*y1*y2; q
3*y0*y1^2*y2
>>> q.degrees()
(1, 2, 1)
>>> (q + y0**Integer(5)).degrees()
(5, 2, 1)
```

**dict()**

Return a dictionary representing `self`. This dictionary is in the same format as the generic MPolynomial: The dictionary consists of ETuple:coefficient pairs.

**EXAMPLES:**

```
sage: A.<x,z,y> = FreeAlgebra(GF(389), 3)
sage: R = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
sage: R.inject_variables()
Defining x, z, y
```

(continues on next page)

(continued from previous page)

```
sage: f = (2*x*y^3*z^2 + (7)*x^2 + (3))
sage: f.dict()
{(0, 0, 0): 3, (1, 2, 3): 2, (2, 0, 0): 7}

sage: f.monomial_coefficients()
{(0, 0, 0): 3, (1, 2, 3): 2, (2, 0, 0): 7}
```

```
>>> from sage.all import *
>>> A = FreeAlgebra(GF(Integer(389)), Integer(3), names=('x', 'z', 'y',)); (x,
    ↪ z, y,) = A._first_ngens(3)
>>> R = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
>>> R.inject_variables()
Defining x, z, y

>>> f = (Integer(2)*x*y**Integer(3)*z**Integer(2) +_
    ↪ (Integer(7))*x**Integer(2) + (Integer(3)))
>>> f.dict()
{(0, 0, 0): 3, (1, 2, 3): 2, (2, 0, 0): 7}

>>> f.monomial_coefficients()
{(0, 0, 0): 3, (1, 2, 3): 2, (2, 0, 0): 7}
```

**exponents (as\_ETuples=True)**

Return the exponents of the monomials appearing in this polynomial.

**INPUT:**

- `as_ETuples` – boolean (default: `True`); if `True` returns the result as an list of ETuples, otherwise returns a list of tuples

**EXAMPLES:**

```
sage: A.<x,z,y> = FreeAlgebra(GF(389), 3)
sage: R = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
sage: R.inject_variables()
Defining x, z, y
sage: f = x^3 + y + 2*z^2
sage: f.exponents()
[(3, 0, 0), (0, 2, 0), (0, 0, 1)]
sage: f.exponents(as_ETuples=False)
[(3, 0, 0), (0, 2, 0), (0, 0, 1)]
```

```
>>> from sage.all import *
>>> A = FreeAlgebra(GF(Integer(389)), Integer(3), names=('x', 'z', 'y',)); (x,
    ↪ z, y,) = A._first_ngens(3)
>>> R = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
>>> R.inject_variables()
Defining x, z, y
>>> f = x**Integer(3) + y + Integer(2)*z**Integer(2)
>>> f.exponents()
[(3, 0, 0), (0, 2, 0), (0, 0, 1)]
>>> f.exponents(as_ETuples=False)
[(3, 0, 0), (0, 2, 0), (0, 0, 1)]
```

**is\_constant()**

Return True if this polynomial is constant.

## EXAMPLES:

```
sage: A.<x,z,y> = FreeAlgebra(GF(389), 3)
sage: P = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
sage: P.inject_variables()
Defining x, z, y
sage: x.is_constant()
False
sage: P(1).is_constant()
True
```

```
>>> from sage.all import *
>>> A = FreeAlgebra(GF(Integer(389)), Integer(3), names=('x', 'z', 'y',)); (x,
    ↪ z, y,) = A._first_ngens(3)
>>> P = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
>>> P.inject_variables()
Defining x, z, y
>>> x.is_constant()
False
>>> P(Integer(1)).is_constant()
True
```

**is\_homogeneous()**

Return True if this polynomial is homogeneous.

## EXAMPLES:

```
sage: A.<x,z,y> = FreeAlgebra(GF(389), 3)
sage: P = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
sage: P.inject_variables()
Defining x, z, y
sage: (x+y+z).is_homogeneous()
True
sage: (x.parent()(0)).is_homogeneous()
True
sage: (x+y^2+z^3).is_homogeneous()
False
sage: (x^2 + y^2).is_homogeneous()
True
sage: (x^2 + y^2*x).is_homogeneous()
False
sage: (x^2*y + y^2*x).is_homogeneous()
True
```

```
>>> from sage.all import *
>>> A = FreeAlgebra(GF(Integer(389)), Integer(3), names=('x', 'z', 'y',)); (x,
    ↪ z, y,) = A._first_ngens(3)
>>> P = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
>>> P.inject_variables()
Defining x, z, y
>>> (x+y+z).is_homogeneous()
```

(continues on next page)

(continued from previous page)

```

True
>>> (x.parent()(Integer(0))).is_homogeneous()
True
>>> (x+y**Integer(2)+z**Integer(3)).is_homogeneous()
False
>>> (x**Integer(2) + y**Integer(2)).is_homogeneous()
True
>>> (x**Integer(2) + y**Integer(2)*x).is_homogeneous()
False
>>> (x**Integer(2)*y + y**Integer(2)*x).is_homogeneous()
True

```

**`is_monomial()`**

Return `True` if this polynomial is a monomial.

A monomial is defined to be a product of generators with coefficient 1.

EXAMPLES:

```

sage: A.<x,z,y> = FreeAlgebra(GF(389), 3)
sage: P = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
sage: P.inject_variables()
Defining x, z, y
sage: x.is_monomial()
True
sage: (2*x).is_monomial()
False
sage: (x*y).is_monomial()
True
sage: (x*y + x).is_monomial()
False

```

```

>>> from sage.all import *
>>> A = FreeAlgebra(GF(Integer(389)), Integer(3), names=('x', 'z', 'y',)); (x,
    ↪ z, y,) = A._first_ngens(3)
>>> P = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
>>> P.inject_variables()
Defining x, z, y
>>> x.is_monomial()
True
>>> (Integer(2)*x).is_monomial()
False
>>> (x*y).is_monomial()
True
>>> (x*y + x).is_monomial()
False

```

**`is_zero()`**

Return `True` if this polynomial is zero.

EXAMPLES:

```
sage: A.<x,z,y> = FreeAlgebra(QQ, 3)
sage: R = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
sage: R.inject_variables()
Defining x, z, y

sage: x.is_zero()
False
sage: (x-x).is_zero()
True
```

```
>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'z', 'y',)); (x, z, y,) = A._
->first_ngens(3)
>>> R = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
>>> R.inject_variables()
Defining x, z, y

>>> x.is_zero()
False
>>> (x-x).is_zero()
True
```

**lc()**

Leading coefficient of this polynomial with respect to the term order of `self.parent()`.

EXAMPLES:

```
sage: A.<x,y,z> = FreeAlgebra(GF(7), 3)
sage: R = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
sage: R.inject_variables()
Defining x, y, z

sage: f = 3*x^1*y^2 + 2*y^3*z^4
sage: f.lc()
3

sage: f = 5*x^3*y^2*z^4 + 4*x^3*y^2*z^1
sage: f.lc()
5
```

```
>>> from sage.all import *
>>> A = FreeAlgebra(GF(Integer(7)), Integer(3), names=('x', 'y', 'z',)); (x,-
->y, z,) = A._first_ngens(3)
>>> R = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
>>> R.inject_variables()
Defining x, y, z

>>> f = Integer(3)*x**Integer(1)*y**Integer(2) +_
->Integer(2)*y**Integer(3)*z**Integer(4)
>>> f.lc()
3

>>> f = Integer(5)*x**Integer(3)*y**Integer(2)*z**Integer(4) +_
```

(continues on next page)

(continued from previous page)

```

→Integer(4)*x**Integer(3)*y**Integer(2)*z**Integer(1)
>>> f.lc()
5

```

**lm()**

Return the lead monomial of `self` with respect to the term order of `self.parent()`.

In Sage, a monomial is a product of variables in some power without a coefficient.

**EXAMPLES:**

```

sage: A.<x,y,z> = FreeAlgebra(GF(7), 3)
sage: R = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
sage: R.inject_variables()
Defining x, y, z
sage: f = x^1*y^2 + y^3*z^4
sage: f.lm()
x*y^2
sage: f = x^3*y^2*z^4 + x^3*y^2*z^1
sage: f.lm()
x^3*y^2*z^4

sage: A.<x,y,z> = FreeAlgebra(QQ, 3)
sage: R = A.g_algebra(relations={y*x:-x*y + z}, order='deglex')
sage: R.inject_variables()
Defining x, y, z
sage: f = x^1*y^2*z^3 + x^3*y^2*z^0
sage: f.lm()
x*y^2*z^3
sage: f = x^1*y^2*z^4 + x^1*y^1*z^5
sage: f.lm()
x*y^2*z^4

sage: A.<x,y,z> = FreeAlgebra(GF(127), 3)
sage: R = A.g_algebra(relations={y*x:-x*y + z}, order='degradlex')
sage: R.inject_variables()
Defining x, y, z
sage: f = x^1*y^5*z^2 + x^4*y^1*z^3
sage: f.lm()
x*y^5*z^2
sage: f = x^4*y^7*z^1 + x^4*y^2*z^3
sage: f.lm()
x^4*y^7*z

```

```

>>> from sage.all import *
>>> A = FreeAlgebra(GF(Integer(7)), Integer(3), names=('x', 'y', 'z',)); (x,
→y, z,) = A._first_ngens(3)
>>> R = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
>>> R.inject_variables()
Defining x, y, z
>>> f = x**Integer(1)*y**Integer(2) + y**Integer(3)*z**Integer(4)
>>> f.lm()
x*y^2

```

(continues on next page)

(continued from previous page)

```

>>> f = x**Integer(3)*y**Integer(2)*z**Integer(4) +_
...x**Integer(3)*y**Integer(2)*z**Integer(1)
>>> f.lm()
x^3*y^2*z^4

>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'y', 'z',)); (x, y, z,) = A.-
...first_ngens(3)
>>> R = A.g_algebra(relations={y*x:-x*y + z}, order='deglex')
>>> R.inject_variables()
Defining x, y, z
>>> f = x**Integer(1)*y**Integer(2)*z**Integer(3) +_
...x**Integer(3)*y**Integer(2)*z**Integer(0)
>>> f.lm()
x*y^2*z^3
>>> f = x**Integer(1)*y**Integer(2)*z**Integer(4) +_
...x**Integer(1)*y**Integer(1)*z**Integer(5)
>>> f.lm()
x*y^2*z^4

>>> A = FreeAlgebra(GF(Integer(127)), Integer(3), names=('x', 'y', 'z',)); (x,
...y, z,) = A._first_ngens(3)
>>> R = A.g_algebra(relations={y*x:-x*y + z}, order='degrevlex')
>>> R.inject_variables()
Defining x, y, z
>>> f = x**Integer(1)*y**Integer(5)*z**Integer(2) +_
...x**Integer(4)*y**Integer(1)*z**Integer(3)
>>> f.lm()
x*y^5*z^2
>>> f = x**Integer(4)*y**Integer(7)*z**Integer(1) +_
...x**Integer(4)*y**Integer(2)*z**Integer(3)
>>> f.lm()
x^4*y^7*z

```

**lt()**

Return the leading term of this polynomial.

In Sage, a term is a product of variables in some power and a coefficient.

**EXAMPLES:**

```

sage: A.<x,y,z> = FreeAlgebra(GF(7), 3)
sage: R = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
sage: R.inject_variables()
Defining x, y, z

sage: f = 3*x^1*y^2 + 2*y^3*z^4
sage: f.lt()
3*x*y^2

sage: f = 5*x^3*y^2*z^4 + 4*x^3*y^2*z^1
sage: f.lt()
-2*x^3*y^2*z^4

```

```

>>> from sage.all import *
>>> A = FreeAlgebra(GF(Integer(7)), Integer(3), names=('x', 'y', 'z',)); (x,
->y, z,) = A._first_ngens(3)
>>> R = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
>>> R.inject_variables()
Defining x, y, z

>>> f = Integer(3)*x**Integer(1)*y**Integer(2) +_
-> Integer(2)*y**Integer(3)*z**Integer(4)
>>> f.lt()
3*x*y^2

>>> f = Integer(5)*x**Integer(3)*y**Integer(2)*z**Integer(4) +_
-> Integer(4)*x**Integer(3)*y**Integer(2)*z**Integer(1)
>>> f.lt()
-2*x^3*y^2*z^4

```

**monomial\_coefficient (mon)**

Return the coefficient in the base ring of the monomial `mon` in `self`, where `mon` must have the same parent as `self`.

This function contrasts with the function `coefficient ()` which returns the coefficient of a monomial viewing this polynomial in a polynomial ring over a base ring having fewer variables.

**INPUT:**

- `mon` – a monomial

**OUTPUT:** coefficient in base ring

↗ See also

For coefficients in a base ring of fewer variables, look at `coefficient ()`

**EXAMPLES:**

```

sage: A.<x, z, y> = FreeAlgebra(GF(389), 3)
sage: P = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
sage: P.inject_variables()
Defining x, z, y

The parent of the return is a member of the base ring.
sage: f = 2 * x * y
sage: c = f.monomial_coefficient(x*y); c
2
sage: c.parent()
Finite Field of size 389

sage: f = y^2 + y^2*x - x^9 - 7*x + 5*x*y
sage: f.monomial_coefficient(y^2)
1
sage: f.monomial_coefficient(x*y)
5
sage: f.monomial_coefficient(x^9)

```

(continues on next page)

>>> f.monomial_coefficient(x*y)
5
>>> f.monomial_coefficient(x**Integer(9))
388
>>> f.monomial_coefficient(x**Integer(10))
0
```

**monomial\_coefficients (copy=True)**

Return a dictionary representation of `self` with the keys the exponent vectors and the values the corresponding coefficients.

INPUT:

- `copy` – ignored

EXAMPLES:

```
sage: A.<x,z,y> = FreeAlgebra(GF(389), 3)
sage: R = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
sage: R.inject_variables()
Defining x, z, y
sage: f = (2*x*y^3*z^2 + (7)*x^2 + (3))
sage: d = f.monomial_coefficients(False); d
{(0, 0, 0): 3, (1, 2, 3): 2, (2, 0, 0): 7}
sage: d.clear()
sage: f.monomial_coefficients()
{(0, 0, 0): 3, (1, 2, 3): 2, (2, 0, 0): 7}
```

```
>>> from sage.all import *
>>> A = FreeAlgebra(GF(Integer(389)), Integer(3), names=('x', 'z', 'y',)); (x,
    z, y,) = A._first_ngens(3)
```

(continues on next page)

(continued from previous page)

```
>>> R = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
>>> R.inject_variables()
Defining x, z, y
>>> f = (Integer(2)*x*y**Integer(3)*z**Integer(2) +_
    - (Integer(7))*x**Integer(2) + (Integer(3)))
>>> d = f.monomial_coefficients(False); d
{(0, 0, 0): 3, (1, 2, 3): 2, (2, 0, 0): 7}
>>> d.clear()
>>> f.monomial_coefficients()
{(0, 0, 0): 3, (1, 2, 3): 2, (2, 0, 0): 7}
```

**monomials()**

Return the list of monomials in `self`.

The returned list is decreasingly ordered by the term ordering of `self.parent()`.

**EXAMPLES:**

```
sage: A.<x,z,y> = FreeAlgebra(GF(389), 3)
sage: P = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
sage: P.inject_variables()
Defining x, z, y
sage: f = x + (3^2)*y*z^2 + (2+3)
sage: f.monomials()
[x, z^2*y, 1]
sage: f = P(3^2)
sage: f.monomials()
[1]
```

```
>>> from sage.all import *
>>> A = FreeAlgebra(GF(Integer(389)), Integer(3), names=('x', 'z', 'y',)); (x,
    - z, y,) = A._first_ngens(3)
>>> P = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
>>> P.inject_variables()
Defining x, z, y
>>> f = x + (Integer(3)*Integer(2))*y*z**Integer(2) + (Integer(2)+Integer(3))
>>> f.monomials()
[x, z^2*y, 1]
>>> f = P(Integer(3)**Integer(2))
>>> f.monomials()
[1]
```

**reduce(*I*)****EXAMPLES:**

```
sage: A.<x,y,z> = FreeAlgebra(QQ, 3)
sage: H.<x,y,z> = A.g_algebra({y*x:x*y-z, z*x:x*z+2*x, z*y:y*z-2*y})
sage: I = H.ideal([y^2, x^2, z^2-H.one()], coerce=False)
```

```
>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'y', 'z',)); (x, y, z,) = A._
    - first_ngens(3)
```

(continues on next page)

(continued from previous page)

```
>>> H = A.g_algebra({y*x:x*y-z, z*x:x*z+Integer(2)*x, z*y:y*z-Integer(2)*y},  
    ↪names=('x', 'y', 'z',)); (x, y, z,) = H._first_ngens(3)  
>>> I = H.ideal([y**Integer(2), x**Integer(2), z**Integer(2)-H.one()],  
    ↪coerce=False)
```

The result of reduction is not the normal form, if one reduces by a list of polynomials:

```
sage: (x*z).reduce(I.gens())  
x*z
```

```
>>> from sage.all import *  
>>> (x*z).reduce(I.gens())  
x*z
```

However, if the argument is an ideal, then a normal form (reduction with respect to a two-sided Groebner basis) is returned:

```
sage: (x*z).reduce(I)  
-x
```

```
>>> from sage.all import *  
>>> (x*z).reduce(I)  
-x
```

The Groebner basis shows that the result is correct:

```
sage: I.std() #random  
Left Ideal (z^2 - 1, y*z - y, x*z + x, y^2, 2*x*y - z - 1, x^2) of  
Noncommutative Multivariate Polynomial Ring in x, y, z over Rational  
Field, nc-relations: {z*x: x*z + 2*x, z*y: y*z - 2*y, y*x: x*y - z}  
sage: sorted(I.std().gens(),key=str)  
[2*x*y - z - 1, x*z + x, x^2, y*z - y, y^2, z^2 - 1]
```

```
>>> from sage.all import *  
>>> I.std() #random  
Left Ideal (z^2 - 1, y*z - y, x*z + x, y^2, 2*x*y - z - 1, x^2) of  
Noncommutative Multivariate Polynomial Ring in x, y, z over Rational  
Field, nc-relations: {z*x: x*z + 2*x, z*y: y*z - 2*y, y*x: x*y - z}  
>>> sorted(I.std().gens(),key=str)  
[2*x*y - z - 1, x*z + x, x^2, y*z - y, y^2, z^2 - 1]
```

### total\_degree()

Return the total degree of `self`, which is the maximum degree of all monomials in `self`.

#### EXAMPLES:

```
sage: A.<x,z,y> = FreeAlgebra(QQ, 3)  
sage: R = A.g_algebra(relations={y*x:-x*y + z}, order='lex')  
sage: R.inject_variables()  
Defining x, z, y  
sage: f=2*x*y^3*z^2  
sage: f.total_degree()
```

(continues on next page)

(continued from previous page)

```

6
sage: f=4*x^2*y^2*z^3
sage: f.total_degree()
7
sage: f=99*x^6*y^3*z^9
sage: f.total_degree()
18
sage: f=x*y^3*z^6+3*x^2
sage: f.total_degree()
10
sage: f=z^3+8*x^4*y^5*z
sage: f.total_degree()
10
sage: f=z^9+10*x^4+y^8*x^2
sage: f.total_degree()
10

```

```

>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'z', 'y',)); (x, z, y,) = A._
    .first_ngens(3)
>>> R = A.g_algebra(relations={y*x:-x*y + z}, order='lex')
>>> R.inject_variables()
Defining x, z, y
>>> f=Integer(2)*x*y**Integer(3)*z**Integer(2)
>>> f.total_degree()
6
>>> f=Integer(4)*x**Integer(2)*y**Integer(2)*z**Integer(3)
>>> f.total_degree()
7
>>> f=Integer(99)*x**Integer(6)*y**Integer(3)*z**Integer(9)
>>> f.total_degree()
18
>>> f=x*y**Integer(3)*z**Integer(6)+Integer(3)*x**Integer(2)
>>> f.total_degree()
10
>>> f=z**Integer(3)+Integer(8)*x**Integer(4)*y**Integer(5)*z
>>> f.total_degree()
10
>>> f=z**Integer(9)+Integer(10)*x**Integer(4)+y**Integer(8)*x**Integer(2)
>>> f.total_degree()
10

```

sage.rings.polynomial.plural.**SCA**(*base\_ring*, *names*, *alt\_vars*, *order*='degrevlex')

Return a free graded-commutative algebra.

This is also known as a free super-commutative algebra.

**INPUT:**

- *base\_ring* – the ground field
- *names* – list of variable names
- *alt\_vars* – list of indices of to be anti-commutative variables (odd variables)

- `order` – ordering to be used for the constructed algebra

EXAMPLES:

```
sage: from sage.rings.polynomial.plural import SCA
sage: E = SCA(QQ, ['x', 'y', 'z'], [0, 1], order = 'degradlex')
sage: E
Quotient of Noncommutative Multivariate Polynomial Ring in x, y, z over Rational
Field, nc-relations: {y*x: -x*y} by the ideal (y^2, x^2)
sage: E.inject_variables()
Defining xbar, ybar, zbar
sage: x,y,z = (xbar,ybar,zbar)
sage: y*x
-x*y
sage: z*x
x*z
sage: x^2
0
sage: y^2
0
sage: z^2
z^2
sage: E.one()
1
```

```
>>> from sage.all import *
>>> from sage.rings.polynomial.plural import SCA
>>> E = SCA(QQ, ['x', 'y', 'z'], [Integer(0), Integer(1)], order = 'degradlex')
>>> E
Quotient of Noncommutative Multivariate Polynomial Ring in x, y, z over Rational
Field, nc-relations: {y*x: -x*y} by the ideal (y^2, x^2)
>>> E.inject_variables()
Defining xbar, ybar, zbar
>>> x,y,z = (xbar,ybar,zbar)
>>> y*x
-x*y
>>> z*x
x*z
>>> x**Integer(2)
0
>>> y**Integer(2)
0
>>> z**Integer(2)
z^2
>>> E.one()
1
```

`sage.rings.polynomial.plural.new_CRing(rw, base_ring)`

Construct `MPolynomialRing_libsingular` from `RingWrap`, assuming the ground field to be `base_ring`.

EXAMPLES:

```
sage: H.<x,y,z> = PolynomialRing(QQ, 3)
sage: from sage.libs.singular.function import singular_function
```

(continues on next page)

(continued from previous page)

```
sage: ringlist = singular_function('ringlist')
sage: ring = singular_function("ring")

sage: L = ringlist(H, ring=H); L
[0, ['x', 'y', 'z'], [['dp', (1, 1, 1)], ['C', (0,)]], [0]]

sage: len(L)
4

sage: W = ring(L, ring=H); W
<RingWrap>

sage: from sage.rings.polynomial.plural import new_CRing
sage: R = new_CRing(W, H.base_ring())
sage: R # indirect doctest
Multivariate Polynomial Ring in x, y, z over Rational Field
```

```
>>> from sage.all import *
>>> H = PolynomialRing(QQ, Integer(3), names=('x', 'y', 'z',)); (x, y, z,) = H._
->first_ngens(3)
>>> from sage.libs.singular.function import singular_function

>>> ringlist = singular_function('ringlist')
>>> ring = singular_function("ring")

>>> L = ringlist(H, ring=H); L
[0, ['x', 'y', 'z'], [['dp', (1, 1, 1)], ['C', (0,)]], [0]]

>>> len(L)
4

>>> W = ring(L, ring=H); W
<RingWrap>

>>> from sage.rings.polynomial.plural import new_CRing
>>> R = new_CRing(W, H.base_ring())
>>> R # indirect doctest
Multivariate Polynomial Ring in x, y, z over Rational Field
```

Check that Issue #13145 has been resolved:

```
sage: h = hash(R.gen() + 1) # sets currRing
sage: from sage.libs.singular.ring import ring_refptr_dict, currRing_wrapper
sage: curcnt = ring_refptr_dict[currRing_wrapper()]
sage: newR = new_CRing(W, H.base_ring())
sage: ring_refptr_dict[currRing_wrapper()] - curcnt
2
```

```
>>> from sage.all import *
>>> h = hash(R.gen() + Integer(1)) # sets currRing
>>> from sage.libs.singular.ring import ring_refptr_dict, currRing_wrapper
(continues on next page)
```

(continued from previous page)

```
>>> curcnt = ring_refptr_dict[currRing_wrapper()]
>>> newR = new_CRing(W, H.base_ring())
>>> ring_refptr_dict[currRing_wrapper()] - curcnt
2
```

Check that Issue #29311 is fixed:

```
sage: R.<x,y,z> = QQ[]
sage: from sage.libs.singular.function_factory import ff
sage: W = ff.ring(ff.ringlist(R), ring=R)
sage: C = sage.rings.polynomial.plural.new_CRing(W, R.base_ring())
sage: C.one()
1
```

```
>>> from sage.all import *
>>> R = QQ['x, y, z']; (x, y, z,) = R._first_ngens(3)
>>> from sage.libs.singular.function_factory import ff
>>> W = ff.ring(ff.ringlist(R), ring=R)
>>> C = sage.rings.polynomial.plural.new_CRing(W, R.base_ring())
>>> C.one()
1
```

`sage.rings.polynomial.plural.new_NRing(rw, base_ring)`

Construct `NCPolynomialRing_plural` from `RingWrap`, assuming the ground field to be `base_ring`.

EXAMPLES:

```
sage: A.<x,y,z> = FreeAlgebra(QQ, 3)
sage: H = A.g_algebra({y*x:x*y-1})
sage: H.inject_variables()
Defining x, y, z
sage: z*x
x*z
sage: z*y
y*z
sage: y*x
x*y - 1
sage: I = H.ideal([y^2, x^2, z^2-1])
sage: I._groebner_libsingular()
[1]

sage: from sage.libs.singular.function import singular_function

sage: ringlist = singular_function('ringlist')
sage: ring = singular_function("ring")

sage: L = ringlist(H, ring=H); L
[
[0 1 1]
[0 0 1]
0, ['x', 'y', 'z'], [['dp', (1, 1, 1)], ['C', (0,)]], [0], [0 0 0],
```

(continues on next page)

(continued from previous page)

```

[ 0 -1  0]
[ 0  0  0]
[ 0  0  0]
]
sage: len(L)
6

sage: W = ring(L, ring=H); W
<noncommutative RingWrap>

sage: from sage.rings.polynomial.plural import new_NRing
sage: R = new_NRing(W, H.base_ring())
sage: R # indirect doctest
Noncommutative Multivariate Polynomial Ring in x, y, z over
Rational Field, nc-relations: {y*x: x*y - 1}

```

```

>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'y', 'z',)); (x, y, z,) = A._.
-> first_ngens(3)
>>> H = A.g_algebra({y*x:x*y=Integer(1)})
>>> H.inject_variables()
Defining x, y, z
>>> z*x
x*z
>>> z*y
y*z
>>> y*x
x*y - 1
>>> I = H.ideal([y**Integer(2), x**Integer(2), z**Integer(2)-Integer(1)])
>>> I._groebner_basis_libsingular()
[1]

>>> from sage.libs.singular.function import singular_function

>>> ringlist = singular_function('ringlist')
>>> ring = singular_function("ring")

>>> L = ringlist(H, ring=H); L
[
[0 1 1]
[0 0 1]
0, ['x', 'y', 'z'], [['dp', (1, 1, 1)], ['C', (0,)]], [0], [0 0 0],
<BLANKLINE>
[ 0 -1  0]
[ 0  0  0]
[ 0  0  0]
]
>>> len(L)
6

>>> W = ring(L, ring=H); W
<noncommutative RingWrap>

```

(continues on next page)

(continued from previous page)

```
>>> from sage.rings.polynomial.plural import new_NRing
>>> R = new_NRing(W, H.base_ring())
>>> R # indirect doctest
Noncommutative Multivariate Polynomial Ring in x, y, z over
Rational Field, nc-relations: {y*x: x*y - 1}
```

sage.rings.polynomial.**new\_Ring**(rw, base\_ring)

Construct a Sage ring out of low level `RingWrap`, which wraps a pointer to a Singular ring.

The constructed ring is either commutative or noncommutative depending on the Singular ring.

EXAMPLES:

```
sage: A.<x,y,z> = FreeAlgebra(QQ, 3)
sage: H = A.g_algebra({y*x:x*y-1})
sage: H.inject_variables()
Defining x, y, z
sage: z*x
x*z
sage: z*y
y*z
sage: y*x
x*y - 1
sage: I = H.ideal([y^2, x^2, z^2-1])
sage: I._groebner_basis_libsingular()
[1]

sage: from sage.libs.singular.function import singular_function

sage: ringlist = singular_function('ringlist')
sage: ring = singular_function("ring")

sage: L = ringlist(H, ring=H); L
[
[ 0  1  1]
[ 0  0  1]
0, ['x', 'y', 'z'], [['dp', (1, 1, 1)], ['C', (0,)]], [0], [0 0 0],
[ 0 -1  0]
[ 0  0  0]
[ 0  0  0]
]
sage: len(L)
6

sage: W = ring(L, ring=H); W
<noncommutative RingWrap>

sage: from sage.rings.polynomial.plural import new_Ring
sage: R = new_Ring(W, H.base_ring()); R
Noncommutative Multivariate Polynomial Ring in x, y, z over Rational Field, nc-
relations: {y*x: x*y - 1}
```

```
>>> from sage.all import *
>>> A = FreeAlgebra(QQ, Integer(3), names=('x', 'y', 'z',)); (x, y, z,) = A._
↳first_ngens(3)
>>> H = A.g_algebra({y*x:x*y=Integer(1)})
>>> H.inject_variables()
Defining x, y, z
>>> z*x
x*z
>>> z*y
y*z
>>> y*x
x*y - 1
>>> I = H.ideal([y**Integer(2), x**Integer(2), z**Integer(2)-Integer(1)])
>>> I._groebner_basis_libsingular()
[1]

>>> from sage.libs.singular.function import singular_function

>>> ringlist = singular_function('ringlist')
>>> ring = singular_function("ring")

>>> L = ringlist(H, ring=H); L
[
[ 0  1  1]
[ 0  0  1]
0, ['x', 'y', 'z'], [['dp', (1, 1, 1)], ['C', (0,)]], [0], [0 0 0],
<BLANKLINE>
[ 0 -1  0]
[ 0  0  0]
[ 0  0  0]
]
>>> len(L)
6

>>> W = ring(L, ring=H); W
<noncommutative RingWrap>

>>> from sage.rings.polynomial.plural import new_Ring
>>> R = new_Ring(W, H.base_ring()); R
Noncommutative Multivariate Polynomial Ring in x, y, z over Rational Field, nc-
↳relations: {y*x: x*y - 1}
```

sage.rings.polynomial.plural.**unpickle\_NCPolynomial\_plural**(R, d)

Auxiliary function to unpickle a non-commutative polynomial.
